> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of
Surrey Ridge

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of
Surrey Ridge

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of
Surrey Ridge

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp/Southridge Preserve development (the **"Project"**) as a concerned resident of the Surrey Ridge community and land use attorney. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local government legally exposed. A conditional referral does

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

> not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*

> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

> 5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can*

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

> *be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL│Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*
>
> *"Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*
>
> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these

conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL | Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated 3,136 Average Daily Trips from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, *the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for 400 vehicles daily* and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already jammed when there's a highway accident, the City's approval

of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of

the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "…*[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded*

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

due process, the county does not retain unfettered discretion." The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City

must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common*

> *areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Commission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

> **Finding Requested.** Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

Jacqueline Post Ladha | Partner
(415) 498-1444 | jacqueline@sequoiallp.com

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Regards,

Jacqueline Post Ladha

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Lone Tree, CO 80124

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

A Concerned Resident of

Re: Public Referral Comments — Hillcamp / Southridge Preserve (RG24-0007, SB25-0009, SB25-0010, SB25-0014)

Dear Members of the Planning Commission and City Council:

I am writing as a resident of 9019 N. Corral Ln in Surrey Ridge regarding the Hillcamp / Southridge Preserve resubmittal currently before the City. The proposed development would place 343 single-family homes on the landlocked mesa top above our community, served by rural roads and a single public collector. I oppose this application as written, for the reasons below.

First and most important: this site does not have an assured water supply. The developer's own off-site utility report admits the Zone 3 supply already has trouble balancing pressure during high demand — before adding 343 new homes. Neighbors who rely on private wells will feel the consequences. The City should not approve a development of this scale without a real water-adequacy determination on the record.

I am writing as someone who lives in a wildfire-prone area and knows what it means not to have a way out. The current proposal serves 343 homes with a single public collector road. The McArthur emergency access is acknowledged in the developer's own materials to be too steep to ever function as a true public road. The fire authority's February letter is conditional, not an unconditional approval. In a high-wind wildfire event, this neighborhood would have nowhere to go.

The Colorado Geological Survey, the State's geotechnical reviewer, formally found the developer's geotechnical record insufficient on January 30, 2026. The site is directly adjacent to a January 2025

landslide on the same hillside, which is currently the subject of litigation. The developer's own drainage engineer concedes that stormwater conveyance over these slopes would create unstable conditions. Permanent homes and a public road should not be approved on ground that has already failed once.

What is being proposed is not a quiet extension of a rural neighborhood. It is an urban village with an amenity center — 343 dense homes organized around a single arterial. That product type does not conform to the rural-residential zoning Lone Tree voters approved in 2000, and the rural Type III and IV roads serving this area were never built to carry it. A mesa top is not a suburb in waiting.

Lone Tree's Comprehensive Plan calls for infrastructure-first growth, natural-resource protection, neighborhood compatibility, and preservation of the rural character at the City's edge. This proposal contradicts every one of those policies. The City has previously denied an application on Comprehensive Plan grounds despite a staff recommendation of approval. The same analysis applies with even more force here.

The traffic numbers in this application are understated. The 343 new homes will put an estimated 1,000 additional vehicles and 3,136 daily trips onto rural roads never built to carry a development of this scale. The RidgeGate and I-25 interchange — which serves Sky Ridge Medical Center — is already projected to reach a failing level of service by 2028 without Hillcamp. On May 15, 2026 a fatal closure on I-25 between Happy Canyon and Castle Pines held residents on these arterials for over three hours. This is not a hypothetical risk.

Lone Tree just adopted the Colorado Wildfire Resiliency Code, effective July 1, 2026. It requires wider access roads, a real second way out, defensible space around homes, and ignition-resistant construction in wildfire-prone areas like this one. Because Hillcamp has not been approved yet, those rules apply. The current design does not meet them — at any level.

The Lone Tree bluffs are confirmed habitat for golden eagles, mule deer, burrowing owls, and an established prairie-dog colony, all of it set against the wetlands and pine forest at the edge of our City. Once this land is paved, that habitat is gone. Open space is the part of Lone Tree most residents say they value most, and it is the part this proposal would most permanently change.

I respectfully urge the Planning Commission and City Council to deny or substantially condition this application until these concerns are addressed on the record. Thank you for the opportunity to be heard.

Sincerely,

James & Sara Ball

9019 N. Corral Ln

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistently with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105 (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 43-1-106 / C.R.S.A. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which requires every planned unit development to be evaluated against, and to be consistent with the standards and conditions set forth in the adopting resolution or ordinance, and under *Friends of the Black Forest Preservation Plan, Inc. v. Board of County Commissioners of El Paso County*, 2016 COA 54, 381 P.3d 396, which vacated a land-use approval under C.R.C.P. 106(a)(4) where the record

fails to support the approval criteria. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-304 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the §29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as ability to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. §29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On *April 21, 2026, the* Lone Tree City Council adopted the Colorado Wildfire Resiliency Code on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103, a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under §302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the §302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR §403 / §404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3100+ cars onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It will also cause near certain deaths if a fire emergency were to occur. The developer's argument that an access to Surrey Ridge would protect those residents, is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before

> approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. §29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC §403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC §D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway.*

> *Because of this elevation difference, a public roadway connection is infeasible at this location." — Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC §403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR §403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC §404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt,*

slate, and concrete tiles" and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan. The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and The Retreat at Ridgegate's own

pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL | Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL | Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL | Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside (subject of Southgate Water v. Century Communities), the record cannot support a competent finding under C.R.S. §30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability

> review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier cured, before approval. C.R.S. § 29-20-104 authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY — CEILING, NOT ENTITLEMENT (C.R.S. § 24-67-105)

C.R.S. § 24-67-105 establishes maximum PDD density as a *ceiling* and grants the City *"wide discretion to negotiate all aspects."* The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks entirely from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating maximum PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder, 927 P.2d 1339, 1348 (Colo. 1996),* the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3000 trips to an already overloaded rural street routing to a highway containing a failing traffic grade of F at one end and significantly increased density at the other (Church and adjacent neighborhoods

including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear we will be trapped as we are occasionally in the mornings when we try to drive our children to school, and were as recently as on May 15, 2026, watching cars wandering our interior streets backed up all the way to the interior of our neighborhood hoping to navigate around standstill traffic. The Colorado Supreme Court in *Board of County Commissioners of Routt County v. O'Dell*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs*, it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 implicates the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County *Public Works* consent.

Two additional property-rights instruments narrow the record further. First, the recorded 1999 "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract, not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-*

sized) would be able to go across the bridge for maintenance and snow removal." That is not related to the EVA nor consent, narrow in scope, from the wrong department, only for F-350 maintenance access to the pedestrian bridge. It is not consent under § 43-1-106 for County-road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Parks & Rec's narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat HOA. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. ... the Project was redesigned to provide water quality in an alternative manner. ... construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under Lazy Dog Ranch; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Surrey Ridge Drive, the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. Colo. Rev. Stat. Ann. § 30-28-106(1). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), in part, that "…*[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/ day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Orten Cavanagh referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL │ Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone … is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is independently preserved within the

> procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under Lazy Dog Ranch; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that, the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

> **Finding Requested.** Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comment received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat HOA, and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge HOA, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Colorado Rules of Civil Procedure (C.R.C.P.) 106(a)(4)*, an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address.

XII. REQUIRED NOTICE NOT PROVIDED

In the City of Lone Tree, a Planned Development District (PDD) amendment is treated as a rezoning application as a PDD functions as its own localized zoning designation, any amendment to it changes the underlying regulations and requires the same formal public review process as a standard rezoning. Sec. 16-15-20. Further, Lone Tree City Zoning Code requires public notice be provided to adjacent landowners within two hundred (200) feet of the land proposed for zoning or rezoning within fifteen (15) days prior to the Planning Commission hearing, and again the same timeframe prior to the City Council Hearing. Sec. 16-15-80. The Surrey Ridge community has not received any formal notice of the adjacent development as of the second referral submission. It seems the City's land use code inherently deprives its residents (and those in neighboring unincorporated lots), of due process and the opportunity to participate with meaningful project review and response in writing prior to Planning Commission review when a project is in stages when feedback can be incorporated during project design without incurring more expensive and difficult changes. The City and developer would have been well served to engage adjacent communities from the onset instead of when the project has already generated voluminous documents to support four applications, and is at the late stage of construction documents.

The notice issue here runs on two parallel tracks across the four-application package, with different natural objectors:

Track A — SB25-0014 (Hillcamp Trail Final Plat)

Adjacent owners to the Hillcamp Drive / Hillcamp Trail alignment include The Retreat at RidgeGate (within Lone Tree city limits), Douglas County parcels along or near the proposed alignment, the McArthur Ranch parcels associated with the EVA access, and parcels along the retaining-wall corridor.

Track B — SB25-0009 and SB25-0010 (Preliminary Plans)

Surrey Ridge is geographically adjacent to the Preliminary Plan area governed by SB25-0009 and SB25-0010 - not to the road plat itself. Surrey Ridge owners did not receive individualized mailed notice for those Preliminary Plan applications. Surrey Ridge is the natural objector on those applications and preserves this defect on the record. The road plat (SB25-0014) exists to serve the development approved under SB25-0009 / SB25-0010; if the Preliminary Plan approvals are voidable for defective notice, the road serves no lawful purpose. The City cannot lawfully advance the road segment as if the procedural defects on the related applications it serves do not exist.

> **Finding Requested.** On Track A: the developer should produce, on the record, an affidavit of mailed notice for SB25-0014, with each adjacent owner served (including unincorporated-County owners), with addresses and dates of service. On Track B: the developer should produce the same affidavit for SB25-0009 and SB25-0010, with particular attention to individualized notice to Surrey Ridge owners in unincorporated Douglas County. Any deficiency on either track should be cured by providing adjacent landowners with sufficient notice to engage the referral process before that closes and goes to the Planning Commission for recommendation. Surrey Ridge preserves this Track-B objection on the present record.

XIII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).

5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.
8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

James Riner

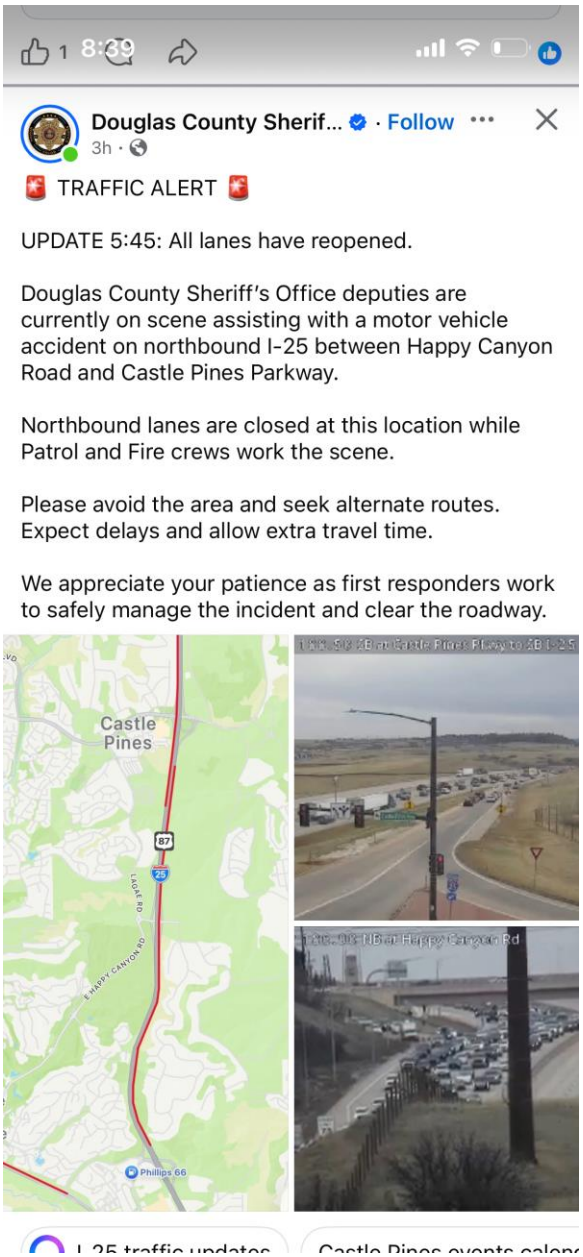
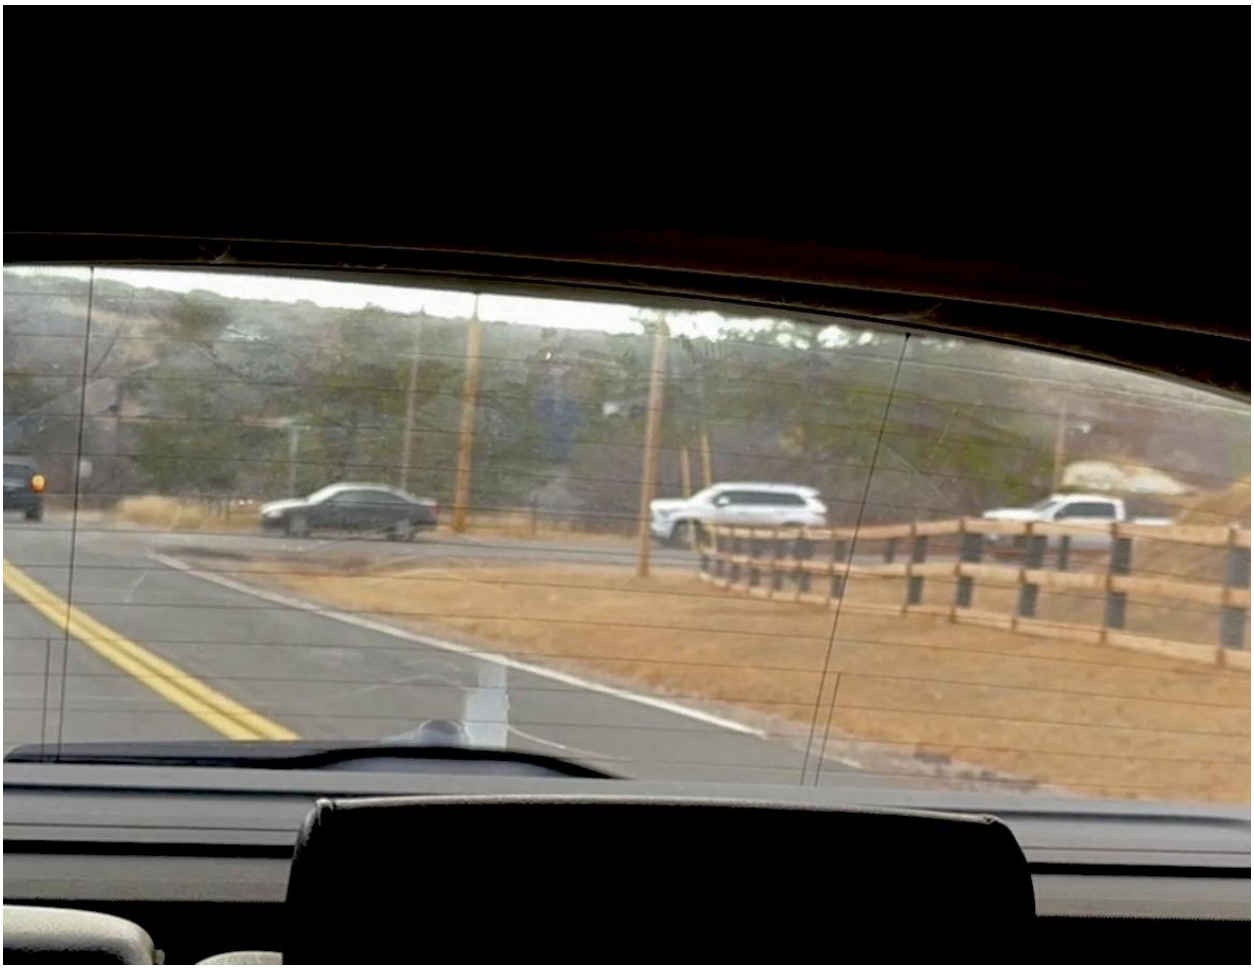
ELK STANDING ON HEATHER DR, MAY 20, 2026. WALKING IN THE ROAD FOR 1 HOUR

SURREY RIDGE EQUESTRIAN COMMUNITY – NO PLACE FOR HILLCAMP TRAFFIC

HORSES AND PEDESTRIANS ON N HEATHER DRIVE – NOT FOR HILLCAMP TRAFFIC



TAKE A LOOK AT THE TRAFFIC AND DOUGLAS COUNTY SHERIFF RECOMMENDATION TO: PLEASE AVOID THE AREA AND SEEK ALTERNATE ROUTES.
SURREY RIDGE WILL BE A CUTTHROUGH NEIGHBORHOOD TO HILLCAMP.



RECENT BACKED UP CUT THROUGH TRAFFIC ON CLYDESDALE ROAD, SURREY RIDGE TURNING NORTH ON TO SURREY DRIVE DUE TO I-25 CONGESTION. THESE CARS WERE ALL EXITING HAVANA TO CLYDESDALE IN ORDER TO BYPASS HAVANA BACKUPS TOO. ALL OF THIS TRAFFIC THEN ENDS UP BACKED UP AT THE ONE LANE UNDERPASS. THIS IS A NON-EMERGENCY SITUATION THAT RESTRICTS FLOW FOR SURREY RIDGE RESIDENTS. CONSIDER THE IMPLICATIONS IF HILLCAMP TRAFFIC IS ALLOWED TO HAVE ACCESS TO SURREY RIDGE AND AN EVACUATION EMERGENCY EXISTS. THIS IS DANGEROUS.

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Re: Public Referral Comments — Hillcamp / Southridge Preserve (RG24-0007, SB25-0009, SB25-0010, SB25-0014)

Dear Members of the Planning Commission and City Council:

I am writing as a resident of long term resident of Castle Pines and real estate agent selling the area for over 25 years regarding the Hillcamp / Southridge Preserve resubmittal currently before the City. The proposed development would place 343 single-family homes on the landlocked mesa top above our community, served by rural roads and a single public collector. I oppose this application as written, for the reasons below.

First and most important: this site does not have an assured water supply. The developer's own off-site utility report admits the Zone 3 supply already has trouble balancing pressure during high demand — before adding 343 new homes. Neighbors who rely on private wells will feel the consequences. The City should not approve a development of this scale without a real water-adequacy determination on the record.

As a long-term real estate agent selling the area and Douglas County, this location is already saturated with surrounding new construction. The local real estate market is flooded with inventory both resale and new construction. This location does not need another 343 homes. Currently, this area already has an oversupply of homes and lack of demand for high density housing. I don't see this as a desirable area for buyers to purchase. I find the location to be the exact opposite in terms of desirability for buyers due to location, wind, traffic pollutants and noise from traffic, hospital flight noise as well as noise from Centennial airport flights.

As someone who lives in a wildfire-prone area and knows what it means not to have a way out. The current proposal serves 343 homes with a single public collector road. The McArthur emergency access is acknowledged in the developer's own materials to be too steep to ever function as a true public road.

The fire authority's February letter is conditional, not an unconditional approval. In a high-wind wildfire event, this neighborhood would have nowhere to go.

The Colorado Geological Survey, the State's geotechnical reviewer, formally found the developer's geotechnical record insufficient on January 30, 2026. The site is directly adjacent to a January 2025 landslide on the same hillside, which is currently the subject of litigation. The developer's own drainage engineer concedes that stormwater conveyance over these slopes would create unstable conditions. Permanent homes and a public road should not be approved on ground that has already failed once.

What is being proposed is not a quiet extension of a rural neighborhood. It is an urban village with an amenity center — 343 dense homes organized around a single arterial. That product type does not conform to the rural-residential zoning Lone Tree voters approved in 2000, and the rural Type III and IV roads serving this area were never built to carry it A mesa top is not a suburb in waiting.

Lone Tree's Comprehensive Plan calls for infrastructure-first growth, natural-resource protection, neighborhood compatibility, and preservation of the rural character at the City's edge. This proposal contradicts every one of those policies. The City has previously denied an application on Comprehensive Plan grounds despite a staff recommendation of approval. The same analysis applies with even more force here.

The traffic numbers in this application are understated. The 343 new homes will put an estimated 1,000 additional vehicles and 3,136 daily trips onto rural roads never built to carry a development of this scale. The RidgeGate and I-25 interchange — which serves Sky Ridge Medical Center — is already projected to reach a failing level of service by 2028 without Hillcamp. On May 15, 2026 a fatal closure on I-25 between Happy Canyon and Castle Pines held residents on these arterials for over three hours. This is not a hypothetical risk.

Lone Tree just adopted the Colorado Wildfire Resiliency Code, effective July 1, 2026. It requires wider access roads, a real second way out, defensible space around homes, and ignition-resistant construction in wildfire-prone areas like this one. Because Hillcamp has not been approved yet, those rules apply. The current design does not meet them — at any level.

The Lone Tree bluffs are confirmed habitat for golden eagles, mule deer, burrowing owls, and an established prairie-dog colony, all of it set against the wetlands and pine forest at the edge of our City. Once this land is paved, that habitat is gone. Open space is the part of Lone Tree most residents say they value most, and it is the part this proposal would most permanently change.

I respectfully urge the Planning Commission and City Council to deny or substantially condition this application until these concerns are addressed on the record. Thank you for the opportunity to be heard.

Kind Regards,
Janet Telitz

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of
Surrey Ridge

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Lone Tree, CO 80124

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

FR: Jeffrey Reinman, Owner and Operator: Summit Valet Parking

TO: Chuck Darnell, Senior Planning Planner

City of Lone Tree, Lone Tree, Colorado

RE: Support for Hillcamp Development

Dear Mr. Darnell,

I own and operate Summit Valet Parking. We run valet for several Lone Tree establishments such as Park Meadows, Perry's Steak House, Fogo de Chao, Edo Higan Sushi and White Chocolate Grill, as well as, the new Jack's Modern Steak House. I am an entrepreneur that started my business in Lone Tree with Park Meadows, and with this strong base my business has grown all across the Denver Metro Area. Our team prides ourselves on the personal relationships we build with many of our clients, and ensuring the high level of service matches the high level of clientele we encounter in Lone Tree.

I am writing to express our strong support for continued quality development and thoughtful population growth within the City of Lone Tree, such as the Hillcamp development. Lone Tree has distinguished itself as a community that balances economic vitality with livability, thoughtful planning, and long-term vision. This success is no accident. It reflects the consistent dedication of city staff, the careful stewardship of its planning professionals.

I would like to specifically recognize the exceptional work of the planning department and city staff. Equally important is the steadfast leadership of the City of Lone Tree over the years. I've got to personally know many of the City staff and the last three mayors well. It has always been a point of pride to work alongside them closely.

The commitment to strategic, forward-thinking decisions has positioned Lone Tree as one of the most desirable places to live and work in the region. I see this personally with the type of resident that chooses to call Lone Tree home.

I believe that well-planned, high-quality development with Hillcamp continues appropriate population growth that will further strengthen the City's economic base, support local businesses, and contribute to a vibrant and sustainable community.

We appreciate your continued efforts and leadership in shaping the future of Lone Tree and encourage the City to approve Hillcamp to remain committed to the principles that have brought Lone Tree success thus far.

Thank you for your time and consideration.

Sincerely,

Jeffrey Reinman – Summit Valet Parking
8401 Park Meadows Dr Drive
Lone Tree, Co 80124

Hello,

I would like to submit my concerns as a resident of The Retreat at RidgeGate, where the developer would like to place an access road (Hillcamp Drive) through one entire side of our cherished open space. We are a small, close-knit community that looks out for each other, the land surrounding us, and the wildlife that lives here. I would request that the city please take the proper precautions to truly evaluate the impact of this road. Please consider the following:

- Our neighborhood is surrounded by bluffs. One of which was impacted by a landslide in May 2024. We witnessed this bluff deteriorate and encroach upon my neighbor's home two doors away. Water infrastructure failed and we witnessed what can only be described as a river running through my neighbor's yard and into Cottonwood Creek. The remediation of this issue a year later was astonishing. More than 100 trucks per day, hauling dirt away for at least a week. Machinery reshaping the hillside for another 2 weeks. Water infrastructure has not yet been re-established. We still do not have fire hydrants functioning at 100% during the dryest winter we have experienced in a very long time. Please consider current litigation due to this landslide and do not place a road here without consideration of what caused the hill to slide. In my opinion, it would be incredibly negligent to place a road adjacent to a failed hillside without understanding the cause.

- This road is going to run right next to this reconstructed hillside, on top of land that has proven to be susceptible to landslides. The road is going to run on top of a bluff adjacent to the failed hillside, which has many large boulders. Please consider the impact of a road at the top of this hill. Please consider potential risks to public safety as countless people recreate on the dirt road directly below. What kind of impact will this road have on the stability of said boulders? This is a danger not only to pedestrians, but also to several homes. Please consider the propensity of unstable land, proven by the neighboring hillside. Please consider public safety.

- Please consider the inevitable noise that the residents of The Retreat will experience for YEARS. I am very concerned about noise levels from road construction for 200+ days, along with Hillcamp construction noise for goodness knows how many years. Noise moves differently here. It is like a football stadium – magnified, echoing and does not filter out easily. Has there been a proper noise analysis completed for this project? Why does our community have to suffer from noise pollution for years? The city should have allegiance to existing residents before considering such a project. Please consider other options that we know are available that have ZERO impact on existing homes/residents.

- Please consider the traffic that our neighborhood, Montecito, patrons of Sierra, Living Spaces, Cabela's and the Marriot Residences will have to endure at the expense of Hillcamp. Why is this road the only planned entrance? The existing roads are not sufficient to handle this additional traffic. What happens if I-25 closes and traffic is routed through Lone Tree, coupled with wildfire and we ALL need to evacuate? Cabela Drive and RidgeGate Parkway cannot handle this traffic. How does this impact the Hospital and emergency vehicles entering the Hospital campus? This road feels very poorly planned and does not provide safe infrastructure for the residents and visitors of Lone Tree.

- It has been quoted that this road has the least impact on wildlife. This is utterly ridiculous. The amount of wildlife I have witnessed migrating on the exact path of the road happens every day. Elk, deer, bear, coyote, porcupines, bobcats - you name it, I have seen it. This is an absolute joke. This road is directly in the path of wildlife movement.

- Please consider the potential risk that this road has in our residents' ability to secure homeowners insurance. This road will have a direct impact on land stability and will increase fire risk. This will also impact our Homeowner Association's ability to secure insurance for our community, which has already become prohibitively expensive.

- Where and how is the water from the Hillcamp neighborhood and road going to drain? Into our bluffs and our neighborhood below? How will this impact the land that has been proven to be susceptible to landslide? Please consider the safety of our neighborhood.

- Please consider increased fire risk to our community because of this road extension and development. Homes, businesses, hospitals and numerous medical facilities are at risk. We live in a dry tinder box with extreme wind conditions. If there is a fire up top due to construction or a spark caused on Hillcamp Drive, it will run downhill quickly. How exactly does a single access point to this large development address the risk of timely fire evacuation for the residents and visitors of Lone Tree?

Thank you for your time. I appreciate the opportunity to comment on this matter.

Re: Referral-Period Comments Regarding Hillcamp/Southridge Preserve—Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a long-time resident of the Surrey Ridge community, and as an attorney who has been involved in numerous encounters regarding Surrey Ridge and its juxtaposition to I-25. There have been numerous attempts in the 42 years that my wife and I chose the equestrian community of Surrey Ridge to raise our family.

All of those previous attempts to come through our community in the name of progress, better access to the highway, etc., have failed, primarily due to the overriding concern for the public health, safety, and welfare of the residents (including children and animals) of our community and Surrey Ridge Estates. That concern should still be paramount in your consideration of the Resubmittal 2 packet for the Hillcamp/Southridge Preserve development. However, numerous other legal arguments must be considered to support your decision in denying approval for the development of the Project. The purpose of this letter is to summarize the arguments and respectfully request that the Planning Commission and the City Council deny the developer's resubmittal for the Project.

The simplest approach would be to accept the arguments presented by the law firm of Orten Cavanagh Holmes & Hunt, LLC, dated May 26, 2026, and submitted for your review. My intent is simply to reiterate key points from a legal perspective that the Planning Commission and City Council must address prior to any approval of the Project. Surrey Ridge, since its inception as an equestrian community in the late 1960's, has vigorously opposed any plans to bring increased traffic through the neighborhood. The most prominent example of this is when CDOT, during the T-Rex expansion of I-25, agreed not to extend Clydesdale Road to the north to Ridgegate or to the south to Castle Pines Parkway in an effort to create a new frontage road on the west side of I-25. Safety was the primary concern, along with avoiding overburdening a community where horses, bicyclists, and children are on the streets of Surrey Ridge and Surrey Ridge Estates daily. CDOT was even concerned about the T-Rex expansion to the point of building, as best they could, sound barriers for our community. The developer on the Project has not once offered to attend any of Surrey Ridge's open community meetings to learn about and address its residents' concerns. That fact alone is disheartening!

There is already considerable expansion and growth at the intersection of Havana Road and Ridgegate. That expansion alone needs to be considered when evaluating the developer's proposal for ingress and egress from the Project, which utilizes N. Heather Drive and directs traffic to proceed through the communities of Surrey Ridge and Surrey Ridge Estates. It appears that the developer's argument is that they are seeking only an "emergency" exit. However, the argument seems disingenuous due to what would be considered an emergency for the residents in the Project would actually create a catastrophe and greater risk to the residents of Surrey Ridge and Surrey Ridge Estates in light of trying to move horses and trailers out of the community with limited ability to do so since the exits are limited to one single lane tunnel and an exit in front of the Journey Church that will place traffic on an already congested Havana Road.

Our community has already been tested because drivers today use their phones and GPS guidance to find an alternate route around congested southbound and northbound traffic on I-25. An appropriate solution has not been found other than the county's desire to slow traffic down by posting marked and unmarked cars on our roadways to ticket speeders. We still get bumper-to-bumper traffic on Clydesdale, not realizing that at either end, when they exit back onto Havana, they will still have to wait until they reach Ridgegate or Castle Pines Parkway. Instead of further development in an already overcrowded area, the focus should be on improving mass transit and promoting better health, safety, and welfare for the citizenry of Douglas County, Colorado. The developer has chosen an exit strategy for what is claimed to be an "emergency" exit only, without fully investigating the total impact it would have on Surrey Ridge and Surrey Ridge Estates.[1]

In adopting the arguments presented by the law firm of Orten Cavanagh Holmes & Hunt, LLC, dated May 26, 2026, the following points are worthy of reiterating again in hopes of demonstrating that the developer of the Project is not fully responding to the City of Lone Tree's past concerns and comments, not to mention those brought forth by the Coalition for the Preservation of Surrey Ridge.

1. The Colorado Wildfire Resiliency Code ("CWRC"), effective July 1, 2026, (already adopted by the City of Lone Tree) cannot be satisfied nor shown by the developer as plans to satisfy such in compliance with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). This concern is of paramount importance in the surrounding communities and the fire hazards identified by the South Metro District.

2. NO adequate water supply finding since the developer's plan does not demonstrate water availability, dependability, and infrastructure capability. "This is mandatory, not discretionary."[2]

3. Lone Tree's adoption of the CWRC on April 21, 2026, becomes a potential challenge if the City of Lone Tree's preliminary approval is internally inconsistent with the CWRC.

4. The City of Lone Tree must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record.

---

[1] No reasonable traffic study has been performed through the communities of Surrey Ridge and Surrey Ridge Estates to determine what dangers there are and whether the roads would even accommodate the traffic that would need to evacuate the area in the event of an emergency, like a fire.

[2] Reference to the Orten Cavanagh Holmes & Hunt, LLC, dated May 26, 2026, Page 2 of 19.

558 Castle Pines Pkwy. Unit B4, #120 • Castle Pines, CO 80108 • Fax-303.845.5817 • Office-303.915.7824 • E-mail-jerryec@comcast.net

5. The requirement of a two-fire-apparatus access road for developments exceeding 30 dwelling units is per IFC Appendix D § D107.1. No evidence has been presented by Douglas County planning to approve the use of its right-of-way that exists in Surrey Ridge and Surrey Ridge Estates.

6. The City of Lone Tree must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

7. The requirements for fire-apparatus access roads pursuant to CWRC § 403 have not been satisfied, thus requiring the preliminary plan to be redesigned and resubmitted with some of the developer's own admissions taken into consideration.

8. C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report.

9. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105) to be made by the City of Lone Tree.

10. Comprehensive Plan conformance required with findings. *See Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance.

11. The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. A new study needs to be conducted by the developer to fully explore the limitations posed by future use of the roads involved.

12. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).

13. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.

14. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing, rather than after the time for meaningful input has concluded, at Planning Commission or City Council hearings.

The above concerns are more fully explained in the arguments presented by the law firm of Orten Cavanagh Holmes & Hunt, LLC, dated May 26, 2026, and submitted for your review.

In short, numerous hurdles and findings must be addressed by the City of Lone Tree Planning Commission and the City Council before any consideration can be given to the developer's second resubmittal, presented on March 27, 2026. More importantly, the developer needs to address more of the city's previous comments and make a genuine effort to consider all the problems facing the proposed

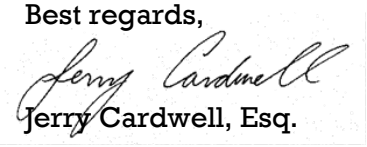
558 Castle Pines Pkwy. Unit B4, #120 • Castle Pines, CO 80108 • Fax-303.845.5817 • Office-303.915.7824 • E-mail-jerryec@comcast.net

development, regardless of where ingress or egress for the future residents of Hillcamp/Southridge Preserve occurs. Instead, the developer chose to have an open forum in Lone Tree that was nothing more than telling the residents of Surrey Ridge and Surrey Ridge Estates that this development has been in the making for 20 plus years, and yet all of the deficiencies in findings and compliance with Colorado statutes have been ignored by the developer. The developer was not the least concerned about the appearance of arrogance in implying that little could be done at this stage.

The communities of Surrey Ridge and Surrey Ridge Estates are the closest you could probably find today to a throwback to the 1950s, where a real sense of community exists, and we continue to support and encourage the residents in our communities to stand up for what they believe is proper under the laws of the state of Colorado and the County of Douglas. Most importantly, to make certain that the state, the county, and the City of Lone Tree take into consideration the public health, safety, and welfare of the residents of Surrey Ridge and Surrey Ridge Estates, together with all other surrounding communities impacted by the developer's proposed Project.

Thank you for your consideration of this referral letter and the opportunity afforded to Surrey Ridge and Surrey Ridge Estates. If there are any further questions, please do not hesitate to give me a call.

Best regards,



Jerry Cardwell, Esq.

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of
Surrey Ridge

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

A Concerned Resident of

Surrey Ridge

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of
Surrey Ridge

Re: Public Referral Comments — Hillcamp / Southridge Preserve (RG24-0007, SB25-0009, SB25-0010, SB25-0014)

Dear Members of the Planning Commission and City Council:

I am writing as a resident of Turf lane regarding the Hillcamp / Southridge Preserve resubmittal currently before the City. The proposed development would place 343 single-family homes on the landlocked mesa top above our community, served by rural roads and a single public collector. I oppose this application as written, for the reasons below.

First and most important: this site does not have an assured water supply. The developer's own off-site utility report admits the Zone 3 supply already has trouble balancing pressure during high demand — before adding 343 new homes. Neighbors who rely on private wells will feel the consequences. The City should not approve a development of this scale without a real water-adequacy determination on the record.

I am writing as someone who lives in a wildfire-prone area and knows what it means not to have a way out. The current proposal serves 343 homes with a single public collector road. The McArthur emergency access is acknowledged in the developer's own materials to be too steep to ever function as a true public road. The fire authority's February letter is conditional, not an unconditional approval. In a high-wind wildfire event, this neighborhood would have nowhere to go.

The Colorado Geological Survey, the State's geotechnical reviewer, formally found the developer's geotechnical record insufficient on January 30, 2026. The site is directly adjacent to a January 2025 landslide on the same hillside, which is currently the subject of litigation. The developer's own drainage engineer concedes that stormwater conveyance over these slopes would create unstable conditions. Permanent homes and a public road should not be approved on ground that has already failed once.

What is being proposed is not a quiet extension of a rural neighborhood. It is an urban village with an amenity center — 343 dense homes organized around a single arterial. That product type does not conform to the rural-residential zoning Lone Tree voters approved in 2000, and the rural Type III and IV roads serving this area were never built to carry it. A mesa top is not a suburb in waiting.

Lone Tree's Comprehensive Plan calls for infrastructure-first growth, natural-resource protection, neighborhood compatibility, and preservation of the rural character at the City's edge. This proposal contradicts every one of those policies. The City has previously denied an application on Comprehensive Plan grounds despite a staff recommendation of approval. The same analysis applies with even more force here.

The traffic numbers in this application are understated. The 343 new homes will put an estimated 1,000 additional vehicles and 3,136 daily trips onto rural roads never built to ycarry a development of this scale. The RidgeGate and I-25 interchange — which serves Sky Ridge Medical Center — is already projected to reach a failing level of service by 2028 without Hillcamp. On May 15, 2026 a fatal closure on I-25 between Happy Canyon and Castle Pines held residents on these arterials for over three hours. This is not a hypothetical risk.

Lone Tree just adopted the Colorado Wildfire Resiliency Code, effective July 1, 2026. It requires wider access roads, a real second way out, defensible space around homes, and ignition-resistant construction in wildfire-prone areas like this one. Because Hillcamp has not been approved yet, those rules apply. The current design does not meet them — at any level.

The Lone Tree bluffs are confirmed habitat for golden eagles, mule deer, burrowing owls, and an established prairie-dog colony, all of it set against the wetlands and pine forest at the edge of

our City. Once this land is paved, that habitat is gone. Open space is the part of Lone Tree most residents say they value most, and it is the part this proposal would most permanently change.

I respectfully urge the Planning Commission and City Council to deny or substantially condition this application until these concerns are addressed on the record. Thank you for the opportunity to be heard.

Sincerely,

Jon Saunders

300 E. Turf Lane

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Lone Tree, CO 80124

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Lone Tree, CO 80124

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of
Surrey Ridge

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Lone Tree, CO 80124

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Lone Tree, CO 80124

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

A Concerned Resident of
Surrey Ridge

May 26, 2026

Dear Mr. Darnell,
We are writing as residents of The Retreat at RidgeGate to submit comment for the public record on the Hillcamp Drive Filing No. 1 application (SB25-0014).

We live at 10877 Bluffside Drive and have lived in The Retreat for four years. We have serious concerns about The Hillcamp Drive proposal. Not only will it remove the trail we use on a daily basis to exercise and walk our dog, but it will also compromise the beauty and safety of the hills and landscape that are just across the street from our home.

We respectfully ask the City to decline to advance this application on the current record.

Our specific concerns are below.

First and foremost, our home is just across the street from the fire road and the now notorious hillside failures from 2024. In fact, that hillside has already failed three times and this land (Tract C) is adjacent to where the proposed construction is supposed to take place.

These hillside failures directly impacted us for more than a year and half. Not only did we have water seep into our basement from the first water main break, but we had construction crews, heavy equipment, noise and an ugly landscape with construction tape and plastic fencing directly in front of our home throughout the nearly 1 ½ year process to rebuild the hillside. The repairs are still not finalized as you can read in a more detailed summary below.

The hillside immediately adjacent to the proposed Hillcamp Drive cut (approximately 120,037 cubic yards of cut and 31,345 cubic yards of fill across 12.26 acres of disturbance, per GESC Report at 6, § 1-C) has a documented utility-failure history. Three water-line breaks occurred on Tract C in 2024 (March 30, May 5, and June 24) and triggered a $500,153 cost-shared hillside repair under the May 6, 2025 Cost Share Agreement between Century

Communities and the City of Lone Tree. The matter is in active litigation in Arapahoe County District Court (Case No. 2025CV30307, trial January 2027).

The permanent replacement waterline is still being designed by Burns and McDonnell and is not yet routed; its bid timing is gated by Shannon and Wilson's geotechnical analysis of Century's discovery production in the active litigation. The applicant's response to this concern is the statement that "it is unrealistic to assume that a utility failure would impact the integrity of the roadway." That answer is inconsistent with the documented record on the adjacent slope.

We ask that the City require, as a condition of any advancement, a finding that the timing and footprint of the Hillcamp construction does not interfere with the not-yet-routed permanent replacement waterline.

We also believe that the City is aware that the developer's proposed plan has never shown a road in the area where they (the developer) is now asking it to be placed. We are failing to understand logically and ethically how those plans can move forward.

Our second major concern is that the road is being placed where no PDD has ever shown one.

We are aware that the RidgeGate Planned Development District has been amended seven times since 2000. None of the seven amendments has ever depicted or designated an access point at the Cabela / Hillcamp end of the mesa-top arterial.

The Surrey Ridge end has been the consistently designated Main Access Road. The applicant's chosen alignment for SB25-0014 abandons the PDD-designated Surrey Ridge access and introduces new access at a location no PDD has ever contemplated, without any PDD amendment. The applicant's stated reason for abandoning the Surrey Ridge corridor is "environmental infeasibility," yet the applicant's own filings show that this same 343-home development plans to run a 12-inch water transmission main through that same Surrey Ridge / I-25 underpass corridor. Logically, a corridor that is

feasible for a water main is also feasible for a road.

We ask that the City require either:
(a) provide a PDD amendment with proper notice, or (b) a finding on the record explaining how this alignment is consistent with the seven existing PDD amendments.

A third concern of ours that we'd like on record is the very real disruption to the beautiful environment, peace and quiet of the community and access to a trail that we use every day and can see from our home and from most vantage points in the community.

Approximately 745 linear feet of existing trail directly adjacent to the proposed alignment will be removed, including approximately 445 linear feet at the Cabela / Viewside connector, with no temporary path provided during construction and no Retreat-side connector replacement proposed.

Construction noise from a 4,077-foot collector road and a multi-year subdivision build-out above will occur within 100 feet of existing Retreat residences over an approximately 250-day window, with Hillcamp Drive serving as the sole construction-access route. The applicant has not provided a noise study and contends that none is required.

As residents who will live with both the construction phase and the long-term operational impact, we ask that the City require an independent noise study and a defined trail-continuity plan as conditions of any advancement.

For the reasons above, we respectfully ask the City of Lone Tree to decline to advance SB25-0014 on the current record.

We are also aware that many other residents, City staff, the Colorado Geological Survey, and South Metro Fire Rescue have expressed concerns and deficiencies in the proposed plans. Those were detailed in referral comments that the City directed on February 11, 2026.

As an entity that is expected to make decisions based on the best interest of the community, the people who live, work and play in this area, we are confident that the City will make honest, astute and thoughtful decisions on this development proposal.

Thank you for entering this comment into the public record for SB25-0014.
Respectfully, Katie and Steve McLean, 10877 Bluffside Drive.

RE: Hillcamp/Mesa Tops Development – Second Referral – Public Comment

Dear City of Lone Tree Planning Staff and Decision Makers:

As a decade plus long homeowner of the Lone Tree community we wish to express our deepest opposition in the Hillcamp development. We sincerely request your consideration in the reasons as noted below to honor our community.

As stated by Mayor Marissa Harmon "her run for office originated from a deep desire to serve and maintain the **quality of life for residents**..". The Bluff trails have been a treasured asset for our community to enjoy the outdoors, to find peace and tranquility from a burgeoning city and home to our wildlife. The trails support the health of our community to enjoy exercise, lowering blood pressure and enjoying a stress-free open space view.

Also noted the purpose of "serving as a city council member is **connecting with the community to make informed decisions that reflect Lone Tree values.**" Our community truly values the bluffs and the surrounding open space and are strongly requesting you honor this area we value.

Below are considerations to reject this development:

Inadequate Resolution of First Round Concerns:

The second referral raises a critical procedure issue:

- The updated application does not appear to have meaningfully resolved core concerns raised during the referral period.
- Major issues (traffic, access, environmental impact) remain fundamentally unchanged.

Advancing the project without addressing these issues undermines the purpose of the public review process.

Loss of Critical Open Space and Community Identity

The Lone Tree bluffs represent one of the last remaining undeveloped mesa-top landscapes in the area – valued for recreation, scenic views, peaceful retreat and community identity.

- We widely view this area as the "heart" and "soul" of Lone Tree due to it's natural character and trail access.

Even with the proposed "open space", much of it is fragmented, internalized, or designed primarily to serve the development rather than the broader public.

Wildlife Habitat Destruction and Ecosystem Fragmentation

The proposed site is currently a functioning wildlife corridor and habitat.

- The bluffs support elk, deer, burrowing owls, and unique bird species that rely on contiguous open land.
- Development would permanently disrupt migration routes and habitat continuity.
- Urbanization (roads, fencing, lighting) introduces long-term ecological degradation, even where "preservation" is claimed.

The proposal appears to underestimate the cumulative and irreversible impacts to wildlife.

Traffic, Safety, and Infrastructure Concerns

Traffic and access remain among the most serious unresolved issues.

- The development could generate thousands of additional daily vehicle trips.
- Proposed connections to roads like Heather Drive or McArthur Drive would push significant cut-through traffic into established residential neighborhoods.
- These roads were not designed for high-volume through traffic and are used by pedestrians, cyclists and families.
- Surrey Ridge and McArthur Ranch equestrian is seriously threatened changing the entire culture and access to the communities.
- Significant traffic has already made Ridgegate Parkway a major thoroughfare often times making it difficult to exit the roundabout during high traffic times. It has also become a thoroughfare if any delayed traffic is impacting I25 as another cut-through increasing the danger to pedestrians, our parks and our neighborhoods.

The reliance of a single or limited access network raises serious questions about feasibility and long -term functionality.

Emergency Access and Wildfire Risk

The site's location and road layout create real public safety risks

- Limited ingress/egress points increase evacuation vulnerability.

- Wildfire risk in bluff and grassland areas is significant, and evacuation capacity must be robust and redundant.
- Any reliance on emergency-only access roads highlights weaknesses in the core transportation plan.

Approving development before resolving these constraints could place residents and neighboring communities at risk.

Geological and Topographic Constraints

Bluff top and mesa-edge development inherently involves geotechnical challenges.

- Steep slopes and variable soils raise concerns about slope stability and erosion. Again, all these highlighted concerns were just brushed over, if not arrogantly dismissed in the initial public comment response from the developer.
- Significant grading and stormwater infrastructure will be required; altering natural drainage patterns.
- Long-term maintenance and risk mitigation may shift burdens to the City or homeowners.

These issues should be treated as **fundamental feasibility concerns**, not minor engineering details.

Water Supply and Sustainability Concerns

Colorado faces ongoing water scarcity challenges, especially for new development.

- Large-scale residential expansion increases long-term water demand.
- There are unresolved questions about whether sustainable water supply has been fully addressed, particularly given regional constraints, not to mention recent enhanced drought conditions.

Approving growth without secure, sustainable water planning is inconsistent with responsible development.

Inconsistency with Community Vision and Prior Expectations

This proposal conflicts with what we believed was protected or intended use for this land.

- Many of us chose to live in Lone Tree for access to open space, trails, and views.
- The scale and placement of this development shifts the character of the community toward dense build-out of remaining natural areas.

Even if you believe this is technically permitted (which we would strongly disagree) this project is **NOT aligned with the spirit of preserving our community**. It is the spirit of our elections and the rightful duty that our elected officials represent the interests of the community.

Inadequate Resolution of First-Round Concerns

The second referral raises a critical procedural issue:

- The updated application does not appear to have meaningfully resolved core concerns raided during the first referral period.
- Major issues (traffic, access, environmental impact) remain fundamentally unchanged.

Advancing the project without addressing these issues undermines the purpose of the public review process.

Zoning Concerns

The land was zoned very broadly – not for the fixed number of significant homes as proposed. It is our understanding that the original zoning was indicated at maximum 60 homes.

- The RidgeGate property (including the bluffs) was annexed in 2000 under a large Planned Development (PD) framework – not a fixed subdivision count.
- That zoning established long-term planning areas and general land uses, not specific build-out numbers.

Current Zoning is "Rural Residential" – low density.

- The Bluff area is identified as Rural Residential within the RidgeGate Planned Development.
- Early conceptual discussions or community expectations often floated very low build-out scenarios (like estate lots) and potentially on the lower elevations.
- Rural residential lots are most often interpreted as very large lots (5+acres)
- Despite being described as "acre-scale" homes, the actual subdivision creates significantly smaller lots once roads, slopes, and infrastructure are accounted for – increasing density beyond what residents expect for this terrain.

- The developer comments “future Preliminary Plan and subdivision plats will define development” means they can still shrink lots, cluster homes, create mixed lot sizes. They are not stating minimum lot sizes and are not showing rough lot yields. They are avoiding any commitment to defer which is a classic sign of higher density than the marketing language suggests.
- The numbers make it mathematically impossible to generate the density housing they are suggesting as Residential Rural.
- The Sub-Area Plan uses rural and estate-style language but does not actually define minimum lot sizes (because the numbers are not there).

The current proposal attempts to maximize density rather than reflect the original intent of low-impact, context-sensitive development for the blufftops.

“Rural Residential” zoning does not mean “maximum allowable units regardless of constraints. It should reflect the **environmental sensitivity** (**as even noted on the Lone Tree signage at the base of the bluffs**), access limitations, wildfire risk, and unique character of this land.

McArthur Ranch was originally homesteaded in 1919 by Edith and Mark D. McArthur, who traveled from the Midwest by covered wagon and were living in Littleton at the time. McArthur Ranch is among the oldest ranches in northern Douglas County, and several **Native American artifacts have been discovered both on the ranch and along the bluff**.

Colorado State Law Protections

Colorado Law protects “historical, prehistorical, and archaeological resources”, including sites tied to early or indigenous cultures.

Development activities that disturb these resources can require:

- Permits
- Surveys
- Formal review BEFORE disturbance

This means you cannot just build first and “handle discoveries later”. That is not how compliance is suppose to work.

Mandatory Consultation and Surveys

Developers are generally expected to:

- Conduct cultural resource surveys
- Identify archaeological sites
- Document them with the State (OAHP)

If this hasn't been completed, the application is premature and incomplete.

I am unsure if any of the project involves federal funding, permits infrastructure or approvals but if so, Section 106 of the National Historic Preservation Act applies. This review must occur before approvals – not after construction begins.

Protection of Archaeological and Native American Cultural Sites

At present, it is unclear if required consultation with Tribal or preservation authorities has occurred.

Approving this project without full and transparent compliance raises serious legal and ethical concerns.

Disturbing or destroying irreplaceable cultural heritage sites – particularly those connected to indigenous history – would be a permanent and unacceptable loss.

This issue alone warrants delaying or more appropriately denying approval.

Given the significant and unresolved concerns outlined above, I respectfully request that:

- The Hillcamp/Mesa Tops applications not be approved and
- The City require substantial redesign, lessening the density and impact as originally intended (60 homes on the lower base) OR deny the proposal outright until critical issues-especially access, safety, environmental impact and community impact are fully resolved.

I will in addition submit our initial response since no meaningful changes occurred from the first public referral.

We sincerely appreciate your consideration in valuing this special and unique open space as a treasure to the community.

Sincerely,

Keira & Steve Rawlings

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Lone Tree, CO 80124

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Lone Tree, CO 80124

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
>
> *"Traffic is expected to primarily enter/exit via Hillcamp Dr. as traffic managed by Surrey Ridge, via N. Heather Dr., is all Type III and IV Rural Local roads and will likely become EVA only through the use process. Emergency vehicle access will be alternately provided via McArthur Drive." — Wildfire Mitigation Plan (HPTT 2025), § 1.2.*
>
> *"The majority of the McArthur Drive emergency access will be +/-10%, which meets emergency access criteria, but is much steeper than the 6% allowed for a public roadway. Because of this elevation difference, a public roadway connection is infeasible at this location."*
>
> *— Community Response Letter (March 27, 2026), Emergency Vehicle Access section.*

These admissions juxtapose against the (deficient) TIS's likely understated, **3,136 average daily trips** from 343 homes, **roughly eight times the 400-vehicle-per-day design capacity of the surrounding Type III/IV network** admitted by the developer's own fire-mitigation consultant. The current Project street geometry inherently cannot satisfy CWRC § 403 without a preliminary-plan-level redesign; the McArthur EVA is admitted to be infeasible for public-roadway use; and the N. Heather EVA depends on a Surrey Ridge / Douglas County rural local network the Surrey Ridge community opposes and the developer concedes is inadequate.

> **Finding Requested.** The City must obtain an SMFR § 403 adequacy memo on the present geometry before approval, and place into the record an analysis of how the Project's 3,136-trip-per-day generation interacts with the developer-admitted 400-vehicle-per-day surrounding network as a suitable EVA. If the geometry does not comply and the traffic analysis is understated, the preliminary plan must be redesigned and resubmitted; § 403 compliance cannot be deferred to building permit.

F. CWRC § 404 - Defensible Space; Setbacks Deleted

CWRC § 404 requires three-zone defensible space in Moderate and High WUI areas: 0–5 ft non-combustible adjacent to structures; 5–30 ft lean/clean; 30–100 ft reduced-fuel zone. The R2 packet does not demonstrate § 404 compliance at the southern grassland edge against The Retreat open space and SH-7 fuels. The defensible-space geometry depends on lot size, lot orientation, and setback discipline, all of which the applicant has eroded. The applicant *deleted* setbacks from the SAP after three rounds of City rejection: *"Consistent with the City's previous comments, remove the standard setback site plan provided on page 4 of the memo; each lot will require unique building envelopes…"* R2 Response Letter, p. 10 (§ 3.4.2 response). Building envelopes are now to be determined administratively at the Final Plat stage. Defensible space cannot be cured at building permit if the lot geometry does not allow it.

> **Finding Requested.** The City must require a CWRC § 404 three-zone defensible-space demonstration on the face of the preliminary plan, with lot-by-lot graphics showing the 0–5 / 5–30 / 30–100 ft zones, before approval. The City may not approve a Sub-Area Plan whose lot geometry forecloses § 404 compliance.

G. CWRC §§ 504–505 - Ignition-Resistant Construction (IR-1 / IR-2)

Under CWRC §§ 504–505, new construction in a Moderate WUI area must meet IR-2 at minimum; in a High WUI area, IR-1 controls (Class A roof assemblies, ignition-resistant eaves/soffits/vents, non-combustible gutters/downspouts, ignition-resistant exterior walls, and window assemblies meeting exterior flame-exposure standards). The R2 SAP, § 3.5.5 (Exterior Materials & Colors), p. 43, requires *"asphalt, slate, and concrete tiles"* and a *"Class A fire rated"* roof, but does not address vulnerable wall coverings and window exposures nor commit to the full IR-1/IR-2 wall, eave, vent, gutter, and window package across the parcel.

> **Finding Requested.** The City must require, on the face of the preliminary plan, an express commitment to IR-1 construction for lots in High WUI areas and IR-2 for lots in Moderate WUI areas, with materials specifications tied to CWRC §§504–505. A generic "Class A roof" commitment is not sufficient; CWRC IR-1/IR-2 is a system requirement, not a roof requirement.

H. CWRC §§ 405–406 - Addressing, Hydrant Location, and Signage

CWRC §§ 405–406 require addressing hydrant placement, and signage on the preliminary plan in a manner that supports emergency response. The Resubmittal 2 packet does not show CWRC-conforming hydrant placement tied to fire flow and does not show CWRC-conforming addressing and signage on the face of the plan.

> **Finding Requested.** The City must require CWRC §§405–406 compliance elements on the face of the preliminary plan, in coordination with the §402 fire-flow certification, before approval.

III. GEOTECHNICAL / SLOPE STABILITY - CGS REFERRAL AND C.R.S. § 30-28-136

C.R.S. § 30-28-136 makes Colorado Geological Survey referral mandatory and requires the Planning Commission to consider the CGS report. The Colorado Geological Survey, the statutory referral agency, has formally found the developer's geotechnical record insufficient.

> *"the current level of geotechnical investigation, analysis, and documentation is insufficient to demonstrate that the proposed Hillcamp Drive roadway extension can be constructed and maintained as a public roadway within mapped landslide terrain, unstable and potentially unstable slopes, and debris-flow-susceptible channels." - CGS Letter dated January 30, 2026, Unique No. DU-26-0010_2 (signed by Amy Crandall, P.E.).*

CGS's January 30, 2026 letter identified the following deliverables required from the applicant, none of which has been delivered in final form: final (not preliminary) geotechnical report; design-level subsurface characterization; specific bench-cut proposal; revised slope-stability analyses reflecting Michael W. West & Associates parameters; water-sensitivity analyses; independent construction-observation plan; and a utility risk mitigation and response plan.

The applicant's March 27, 2026 City Response Letter at page 20 declined the utility risk plan, taking the position that "*There are no water lines within the roadway and it is unrealistic to assume that a utility failure would impact the integrity of the roadway*," a position in direct tension with three recent water-line breaks on the same hillside in 2024 and the Retreat at Ridgegate, LLC's own pending litigation (Case No. 2025CV30307) alleging utility-failure causation of the January 2025 slope failure on the same hillside.

The developer's March 27, 2026 Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation (CTL │Thompson Project No. DN52,378-125-L2) is the operative geotechnical submission. It is internally limited and contains four undeniable admissions:

> *" The purpose of our investigation was to evaluate subsurface conditions to assist in due diligence assessment and **preliminary** planning of site development and construction and assess slope stability for the existing slopes." — CTL│Thompson, March 27, 2026, p.1 [Emphasis added].*

> *" Site slopes are very steep, precluding rig access in many locations. Our boring locations were selected in areas we could safely access." — Id. p. 6.*

> *"Based on previous studies within the Ridgegate Development and near I-25, landslides and slope failures have occurred within the claystones and sandstones..." — Geotech Response Letter, Geological Hazards and Slope Instability, Revised March 27, 2026, p.9.*

The CTL slope-stability table in the same March 27, 2026 letter reports interim factors of safety below the 1.5 industry preferred minimum for permanent infrastructure and at or below the 1.3 minimum for critical temporary excavations (1.1 noted) *Id.*p.7. CTL further notes, "Although the interim models generally resulted in lower [factor of safety] values than the existing and proposed conditions, we believe these values are acceptable due to the short-term duration of these conditions and not indicative of the overall global stability of the slope." *Id.* The report recommends moving drainage ponds to those interior portions of the site, strongly implying that construction would not be suitable in these locations. Other cross-sections show interim or proposed-elevated-groundwater FOS values of 1.3 or 1.4, uncomfortably close to the failure threshold but then dismisses them as acceptable due to the short-term duration of those conditions. *Id., p.11.* The report further discusses temporary slope layback of 1.6H:1V, steeper than standard, in the same section where it concedes, with emphasis "*Changes to proposed grading, site grading techniques, and surface drainage will impact slopes stability along these sections*." Updated Preliminary Geotechnical Investigation and Slope Stability Evaluation, Revised March 27, 2026, p.8.

The developer's own Drainage Outfalls Memorandum (JR Engineering, March 27, 2026) corroborates the slope vulnerability, with emphasis:

> *"Per the geotechnical recommendations for the Site, the stormwater flows are not to be conveyed over the steep hillsides surrounding the project area, as these flows would create unstable slope conditions." — Drainage Outfalls Memorandum, March 27, 2026, p. 1.*

Ground Engineering (third-party geotechnical reviewer for the developer) noted the developer's low FOS values, and coincidentally, introduced a lower standard: *"We generally do not consider factor of safety values for non-critical temporary/interim conditions less than 1.1 to be acceptable."* Trail Geotechnical Response Letter (CTL │Thompson, revised March 27, 2026), Ground Engineering Comments section. Combined with the May 2024 Tract C landslide on the same hillside which is the subject of *Southgate Water v. Century Communities*, the record cannot support a competent finding under C.R.S. § 30-28-136.

> **Finding Requested.** C.R.S. § 30-28-136 makes CGS referral mandatory and requires the Planning Commission to consider the CGS report. The City must require an independent slope-stability review by the Colorado Geological Survey on the record, on the present alignment, with any missing borings completed and the developer's "planning purposes only" qualifier

> cured, before approval. C.R.S. § 29-20-104(1)(a) authorizes the City to deny development in hazardous areas. A "planning purposes only" geotechnical letter, with interim FOS values at or below the 1.3 industry minimum, with the developer's own drainage engineer admitting that stormwater conveyance over the surrounding hillsides "would create unstable slope conditions," and against a backdrop of known post-construction slope failures on the same hillside, cannot support a competent finding under § 30-28-136.

IV. PDD DENSITY - REQUIRES CAPACITY FINDINGS (C.R.S. § 24-67-105)

C.R.S. § 24-67-105(4) mandates the City establish create its own density metrics. The SAP itself acknowledges it is not self-executing: *"The City shall use this SAP, the two applicable PDDs, and other applicable City code in the review and approval process."* R2 SAP, § 1.2 (Purpose of the Sub-Area Plan), p. 7. The R2 SAP further states that *"the criteria provided in this SAP are not exhaustive and that the City code applies to topics not otherwise addressed in this document." Id.* Despite that, no findings in the Resubmittal 2 packet tie the 343-unit count (261 RidgeGate + 82 Southridge, per the March 27, 2026 Project Narratives) to *demonstrated* water, fire, geotechnical, or transportation capacity. The applicant deleted setbacks from the SAP after three prior City rejections: City staff has stated on the record that the SAP's bulk-setback approach is not consistent with the intent of the underlying Planned Developments, and further, that "each lot will require unique building envelopes to ensure consistency with the Planned Development" (Southridge City Response Letter, Technical Memorandum: Grading and Limits of Disturbance, March 27, 2026, ¶2).

> **Finding Requested.** The City must make findings under C.R.S. § 24-67-105 tying any approved density to demonstrated infrastructure capacity (water, fire, geotechnical, and transportation) on the present record. Without those findings, treating PDD density as entitlement is an abuse of discretion. Density approved on an SAP that has deleted its setback standards and deferred its building envelopes to administrative determination cannot satisfy § 24-67-105.

V. COMPREHENSIVE PLAN CONFORMANCE REQUIRED WITH FINDINGS

Under *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder,* 927 P.2d 1339, 1348 (Colo. 1996), the Court noted that a specificity requirement obligates a municipal entity to note specific findings that are properly applied and not undercut a desirable degree of flexibility to strike the right balance. In this case, the City of Lone Tree applied this standard in Resolution 22-05 (Living Water Car Wash), unanimously denying the application on Comp Plan grounds notwithstanding a staff recommendation of approval. Resolution 22-05 is binding City precedent on method.

The R2 packet does not contain a Comp Plan conformance analysis. The R2 Response Letter and the four Project Narratives contain no Comp Plan section. The Project pushes material substantive decisions to a future Development Agreement that is not before the Planning Commission and not subject to public hearing, including height variances, geotechnical lot review, active landslide mitigation, wildfire-mitigation maintenance, fencing, irrigation, traffic impacts, wildlife mitigation related to burrowing owls and the nearby golden eagle nest, parks, and Tract X HOA structure. R2 Response Letter, pp. 10–11 (§§ 1.4.1, 1.4.2, and 3.4.2 responses).

> **Finding Requested.** The City must identify each Comp Plan policy implicated (at minimum: infrastructure-first, sustainability/resilience, natural-resource protection, neighborhood compatibility, rural character) and find conformance or non-conformance for each. For any departure, the City must state the specific findings Snyder and Resolution 22-05 require. A Comp Plan finding that exists only by recital and not by analysis is not a finding.

VI. TRAFFIC AND TRANSPORTATION - TIS ADEQUACY

The developer's Traffic Impact Study (JR Engineering, March 24, 2026) is faulty and projects an understated **3,136 Average Daily Trips** from the Project. *Id* .p.7. The companion I-25 & RidgeGate Parkway Traffic Memorandum (JR Engineering, March 27, 2026) makes two material admissions:

- Existing-conditions LOS F at the SB I-25 Off-Ramp & RidgeGate Parkway, SB Left, PM Peak (Year 2026), highlighted by the developer's own engineer as failing to meet the established LOS D threshold. I-25 & RidgeGate Parkway Traffic Memo, Table 1 p.9.
- CDOT access permit required by 2028 less than 2 years from now. The developer admits site-generated traffic exceeds the 20% threshold on four interchange movements: NB I-25 Off-Ramp & RidgeGate Parkway EB Right AM Peak (58%); NB I-25 Off-Ramp NB Left PM Peak (26%); SB I-25 Off-Ramp EB Right AM Peak (22%); SB I-25 Off-Ramp SB Right PM Peak (53%). Id. Access Permit Requirement section. The proposed "fix" is "optimized signal timings," a CDOT-controlled action, not a developer commitment. *Id.*

Methodology gaps remain: only a single weekday count when communities are bedroom communities (Thursday, February 5, 2026) at the I-25 ramps and a 24-hour tube count at RidgeGate Parkway & Cabela; no weekend data; no cumulative-impact analysis with other approved RidgeGate-area development (increased Canyons density, LifeTime Fitness, new large mixed use development on Castle Pines Parkway); no GPS routing analysis; entire omission of the Surrey Ridge North Tunnel; no operational analysis of the proposed EVAs.

Crucially, the developer's own Wildfire Mitigation Plan admits that the surrounding network is designed for **400 vehicles daily** and is composed of Type III/IV rural local roads (see Section II.E above). The TIS does not reconcile a 3,136-trip generation with the 400-vehicle-per-day surrounding-network capacity admitted in another section of the same R2 packet. In a wildfire evacuation on streets that are already

jammed when there's a highway accident, the City's approval of this analysis could cause great harm to its residents and those over the City line in unincorporated neighborhoods.

> **Finding Requested.** The City must make specific findings on TIS adequacy before approval, including: (a) compliance or non-compliance with the City's own study scope; (b) reconciliation of the 3,136-trip projection with the developer-admitted 400-vehicle-per-day surrounding capacity; (c) responsiveness to CDOT's I-25 interchange comments, including reduction of LOS F at SB I-25 Off-Ramp E2; (d) GPS analysis; (e) inclusion of the Surrey Ridge North Tunnel and cumulative-impact analysis; and (f) operational analysis of the EVAs themselves taking Surrey Ridge and Oak Hills communities equestrian communities into account. At a minimum, the developer should provide an updated TIS, complete the CDOT access permit process, incorporate weekend and multi-day counts, and post funded intersection improvements with developer bonding.

VII. ACCESS AND EXTRATERRITORIAL AUTHORITY

A. March R2 SAP - EVA Designation on Deficient ROWs

The March 2026 SAP materially changed the access framing from prior submittals. The operative recital is now:

> *"Two (2) additional emergency only access points will be provided with connections to McArthur Drive to the west and Heather Drive to the south...*" Each emergency only access point is planned to be gated and will access existing public right-of-way — *Community Response Letter (March 27, 2026), Access, Traffic, and Cut Through Concerns section, p1.*

The developer's recharacterization of these access points as EVA-only, in ROW not dedicated to manage the traffic impact and does not resolve the legal access defects identified in subsections B–D below.

B. Surrey Ridge - Equestrian Community; Existing Egress Already Deficient

Surrey Ridge communities consist of approximately 170 homes and lie outside City limits in unincorporated Douglas County. It does not have the infrastructure to support EVA-only ingress and egress to a 343-home subdivision on the mesa above it, nor the capacity to support an evacuation – the purpose of the proposed EVA. Surrey Ridge residents have already advised the City and County that they believe their emergency egress is deficient at present *and* Surrey Ridge is an equestrian community whose residents would need to trailer horses and livestock out of the area in the event of an emergency. If the Project were to be approved and a fire were to start at the Project location, residents would surely be trapped, as already happens periodically due to highway accidents on I-25. Further, Surrey Ridge is constrained to the east by rural, windy interior streets to exit the neighborhood, a one lane underpass on one end, and a shared larger exit at the other end, but a church and second neighborhood share that egress route as their main artery as well. Adding over 3,000 trips to an already overloaded rural street routing to

a highway containing a failing traffic grade of F at one end and significantly increased density at the other (sharing capacity with a church and adjacent neighborhoods including the new Canyons multifamily densities, new mixed use on Castle Pines Parkway, Ridgegate East), will compound and exacerbate any need to evacuate. Residents fear they will be trapped as they are occasionally in the mornings when driving their children to school, and were as recently as on May 15, 2026, watching cars wandering their interior streets backed up all the way to the interior of the neighborhood hoping to navigate around standstill traffic.

The Colorado Supreme Court in *Bd. of Com'rs of Routt Co. v. O'Dell, 920 P.2d 48 (1996)*, upheld a county's rejection of a 41-acre minor subdivision. The denial was based on several combined factors in the administrative record similar to those here, including critical wildlife range, lack of water for fire suppression, inadequate emergency vehicle access, and severe soil/slope limitations. Further, in landmark cases like *Sellon v. City of Manitou Springs,* 745 P.2d 229 (1987), it is well established that local governments have strong legal authority to enact and enforce strict hillside, slope, and erosion regulations. In that case, the court ruled that such ordinances are constitutional so long as they do not deprive a landowner of all reasonable use of their property. The case further noted that if technical engineering reports or fire district reviews dispute a developer's claims, a governing body is well within its rights to reject the developer's generalized assurances.

C. Douglas County Consent - Narrow Parks-and-Rec Email; No Public Works Consent of Record

Douglas County has statutory authority over County roads under C.R.S. § 43-1-106. Douglas County's prior February 9, 2026, communication confirmed that McArthur Drive is partly on private land via never-formalized prescriptive rights, that the County has no plans to pave, and that the County would not support a full public opening. C.R.S. § 24-65.1-202 indicates that the City should analyze the environmental, socioeconomic, and traffic impacts of key facilities that are considered for the broader region, which effectively addresses spillover effects into unincorporated areas. While not necessarily a project of state interest, the City has worked with the developer of the subject Project for over two decades for the larger expansive City development including future City works buildings, Ridgegate East which includes a new school, senior center, PUDs of residential homes and amenities. The City and Project developer have a symbiotic relationship wherein each development provides the City with added tax revenue, the developer with more profit, and feeds larger development needs for the City. This relationship makes the subject Project application part of a larger regional development objective of the City and may influence the City's review and/or implicate this code provision. Further, the Resubmittal 2 packet does not contain a recorded easement nor a Douglas County Public Works consent.

Two additional property-rights instruments narrow the record further. First, the recorded "Non-Exclusive Easement for Driveway Purposes," Doc. No. 99014022 (recorded February 4, 1999), limits use to driveway purposes for a specific tract (Tract 56), for egress and access to utilities to Tract 56; not mass civilian or emergency egress for 343 homes. Second, the 2004 Southridge Preserve PDD limits McArthur access to "emergency personnel and City use only" via a gated road, not mass civilian evacuation of 343 homes. Even if the geometric standards could be met, the legal authorization to use McArthur for

emergency egress for 343 homes is not in the record. The only Douglas County document the developer added in March is an email exchange with Nick Giauque, *Park Program Manager, Douglas County Department of Parks and Recreation,* dated March 9, 2026. Parks and Recreation's only stated concern is: *"The only concern we had was making sure that our trucks (F350-sized) would be able to go across the bridge for maintenance and snow removal."* This letter relates to a pedestrian bridge and has no bearing on the EVA access rights, maintenance. It is not consent under § 43-1-106 regarding County road impacts from the McArthur Drive or N. Heather Drive EVAs. The developer's own February 17, 2026, email asks Douglas County to *"confirm that Douglas County will accept ownership and maintenance of the bridge,"* Worth noting, while unrelaed to the EVA, Parks & Recreation is not the affirming agency for ownership of the pedestrian bridge and its narrow reply does not affirmatively answer that ownership question.

D. Tract M - Developer Has Abandoned Tract M; Replacement Water-Quality Design Must Be Tested

Tract M is owned by The Retreat at Ridgegate Homeowers Association. Eighty (80%) homeowner approval is required for conveyance and is acknowledged as unavailable. The developer, in its March 27, 2026, Retreat Response Letter (Brownstein Hyatt Farber Schreck), now *abandons* Tract M as a Project component:

> *"[Tract M] is Not Necessary for the Project. … the Project was redesigned to provide water quality in an alternative manner. … construction or reliance on Tract M is no longer needed for the Project." - Retreat Response Letter (Brownstein Hyatt Farber Schreck), March 27, 2026, § II.A, p. 2.*

Yet, it appears that Tract M remains in the developer's preliminary construction documents stamped as of March 27, 2026, the same day as the developer's legal counsel response stating that Tract M is longer in play. Assuming that legal communication is accurate, that removes Tract M as a direct property-rights obstacle. It does *not* remove the question whether the replacement water-quality design is itself defective, or whether the redesign creates new stormwater or slope-stability impacts on the hillsides immediately above Surrey Ridge. The City must test the replacement on its own merits.

E. 2020 Easement (Reception No. 2020069125) - Overburdening Under Lazy Dog Ranch

The Retreat Response Letter affirmatively names the legal-access basis for the Project: *"the subject property already benefits from a perpetual, non-exclusive easement, recorded in the real property records of Douglas County at Reception No. 2020069125 on July 30, 2020 [the 'Roadway Easement'], providing the legal right to access the property."* Retreat Response Letter, p. 7. The 2020 easement was granted to RidgeGate Investments before Rampart Range Metropolitan District conveyed approximately 374 acres to the City. The applicant now asserts that easement as the legal basis for a 4,077-foot collector road (now branded "Hillcamp Trail"), three tiers of retaining walls (up to 25 feet, 1,123 linear feet), a 120-foot pedestrian bridge on drilled caissons, and permanent traffic and emergency-vehicle loading.

Under *Lazy Dog Ranch v. Telluray Ranch Corp.*, 965 P.2d 1229 (Colo. 1998), and Restatement (Third) of Property: Servitudes § 4.10, the holder of a blanket easement may not materially intensify use beyond what was contemplated by the original grant. The R2 packet contains no analysis of the 2020 easement's

scope, no comparison of the original contemplated use to the proposed use, and no answer to the overburdening question.

> **Finding Requested.** The City must, as conditions precedent to approval: (a) require recorded easements or fee ownership for all emergency-access routes, supported by Douglas County Public Works consent under § 43-1-106; (b) make specific extraterritorial-impact findings under § 24-65-103; (c) require the developer to place the 2020 Roadway Easement (Reception No. 2020069125) into the record with a scope analysis under *Lazy Dog Ranch*; and (d) require an independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.

VIII. PDD INCONSISTENCY — RIDGEGATE 7TH AMENDMENT MAIN ACCESS ROAD; ALTERNATIVE ALIGNMENT 7

The RidgeGate PDD 7th Amendment designates a "Main Access Road" / Conceptual Roadway for any mesa-top development off Heather Drive, yet the developer expressly engages and *rejects* any alternative alignment referred to as Alternative Alignment 7, in its March 27, 2026 Retreat Response Letter:

> *"The Conceptual Roadway was thoroughly evaluated by the Applicant along with multiple other alternatives, as shown in the Alternative Access Memo … seven roadway alternatives were compared … Alternative 1 [the proposed alignment] is the least impactful option that meets the applicable access and safety requirements." — Retreat Response Letter, p. 6.*
>
> *"… the Surrey Ridge options (which are labeled Alternatives 6 and 7 in the Alternative Access Memo) … were evaluated and found to raise material environmental and community-compatibility concerns such as disrupting wildlife movement access to Happy Canyon Creek, requiring extensive cuts and scrub oak removal, and creating significant visual impacts to prominent bluffs … in addition to having certain additional emergency-access and design-standard constraints …" — Retreat Response Letter, p. 7.*

Unlike binding regulations, a master plan is a guide to development rather than an instrument to control land use. C.R.S. § 30-28-106(3)(a). The RidgeGate PDD 7th Amendment, Reception No. 2020012568 (recorded February 21, 2020, revised June 7, 2024), at Sheet 7 of 8, labels the Surrey Ridge access as *"Main Access Road"* and the opposite end as *"Limited Emergency Access."* Both labels appear as distinct PDD elements. The Sheet 8 disclaimer that circulation elements are "conceptual in nature and subject to modification and refinement" permits refinement *within* a designation; it does not permit *inversion* of which end is main and which is emergency. The applicant has not sought a PDD amendment. The developer's multi-criteria override of the PDD-designated Conceptual Roadway is, in substance, a quasi-amendment without the PD-amendment process. It is further noted in *Bd. of Cnty. Comm'rs of Larimer Cnty. v. Conder*, 927 P.2d 1339, 1351 (Colo. 1996), that "*…[I]n requiring master plan compliance, the master plan provisions at issue must be drafted with sufficient exactitude so that proponents of new development are afforded due process, the county does not retain unfettered discretion."* The case further noted that the basis for the county's decision must be clear for purposes of reasoned judicial review.

To be clear, neither the developer nor the City can amend a master plan without affording due process to impacted residents. Moreover, for the avoidance of doubt, Surrey Ridge's road is not a feasible main road despite its inclusion in a master plan. It is rated for 400 cars/day, designed for rural residential unincorporated county use and has no known funds allocated for improvement. Despite its assertions in the Project application, the developer can't sidestep the application and approval process to suit its own benefit.

A. The "Environmentally Infeasible" Rationale Is Contradicted by the Applicant's Own Infrastructure Routing

The developer further characterizes the Surrey Ridge corridor (Alternative 7) as "environmentally infeasible." Yet, three of the applicant's own contemporaneous documents simultaneously plan a 12-inch Future Zone 3 water transmission main through the same corridor:

- October 2023 Southridge Preserve Water Demand Study (referenced in the February 10, 2026, Retreat referral response at p. 6), planned 12-inch transmission main through the Surrey Ridge / I-25 underpass corridor.
- PWSD inclusion materials for Tract AZ (per City 3rd Technical Review Sheet 20 comments), proposed water improvements in the Surrey Ridge corridor.
- SB25-0010 4th Submittal Comment Response at p. 42 - applicant confirms coordination with PWSD on "off-site water and sewer mains to the site … being designed and constructed with RRMD as a separate project."

A 12-inch transmission main requires deep trenching, a continuous disturbance corridor, permanent utility easements, and ongoing maintenance access. If the corridor accommodates a 12-inch transmission main, it accommodates a roadway. The City's Technical Review found the access memorandum's justifications were not supported by thorough analysis. The contemporaneous water-main routing converts that finding from "unsupported" to demonstrated pretext: the applicant's own infrastructure decisions prove the corridor is feasible, and the "environmental" rationale was constructed to justify cost avoidance for the I-25 underpass improvements that would be required by the PDD-designated alignment.

> **Finding Requested.** The City must place the RidgeGate PDD 7th Amendment Main Access Road sheet, the developer's Alternative Access Memo, and the underlying Alternative multi-criteria scoring into the record on each of the four applications. The City must then make an express finding that the proposed Alternative 1 (Cabela Drive / Hillcamp Trail) is consistent with the PDD Main Access Road designation. To reiterate, while the Surrey Ridge community expressly opposes any neighborhood connection, a developer cannot displace a PDD-designated Main Access Road by its own multi-criteria scoring without public process and fail to evaluate available alternatives. In this case, there are one to two alternative options not on the plans that the developer has failed to explore entirely.

IX. FEDERAL AND STATE WILDLIFE — BGEPA, MBTA, AND CPW BUFFERS

The developer's March 2026 Wildlife Preservation Plan (CTL | Thompson Project No. DN52,036.000-232-R1R3) addresses CPW's January 19, 2026, raptor / golden eagle concerns. The relevant developer representations:

> *"... a Golden Eagle nest mapped approximately 0.9 miles from the southwestern tip of Subject Property, and 0.95 miles from the nearest residential lots on the Subject Property. CPW provides ¼-mile and ½-mile mapped buffer zones from the Golden Eagle nest. The ½-mile buffer zone ... is at its closest point approximately 0.4 miles from the Subject Property." — Wildlife Preservation Plan, § 3.2 (Migratory Bird, Raptor, and Eagle Habitat).*
>
> *"CPW recommends No Surface Occupancy beyond that which has historically occurred in the area within ¼-mile of active nests and no permitted, authorized, or human encroachment activities within ½-mile radius of active nests from December 15 through July 15. The development of the Subject Property does not encroach on recommended raptor buffer zones[;] no further action is required regarding the nearby Golden Eagle nest." — Id.*

Three issues remain even on the developer's representation. First, the 0.9-mile distance is the developer's consultant's representation, not CPW's confirmation. CPW should be asked to verify nest coordinates and confirm the buffer geometry. Second, the developer treats the 0.5-mile buffer as a static geographic line; construction noise, dust, blasting, and traffic dispersal from a 343-home subdivision and its 4,000+-foot collector with caisson-mounted pedestrian bridge may carry into the buffer projection even when the property line does not. CPW should opine on whether construction activity within line-of-sight of the nest during the December 15–July 15 sensitive period triggers the no-permitted-activity provision. Third, the Wildlife Preservation Plan confirms prairie dog burrows on the property (potential burrowing-owl habitat; breeding season March 15–August 15) and identifies multiple SWAP Tier 1 bat species; the proposed prairie-dog removal sequence and timing need CPW concurrence.

Bald and Golden Eagle Protection Act penalties for an organizational violation can reach up to $500,000. CWA § 404 / Sackett v. EPA jurisdictional analysis is engaged by the developer's Trail Biological Assessment but the wetlands and Waters-of-the-U.S. conclusions are the developer's consultant's, not an independent Corps determination of record.

> **Finding Requested.** The City must require, on the record before approval: (i) CPW concurrence with the developer's 0.9-mile nest distance, the 0.4-mile buffer-edge geometry, and the conclusion that the Project does not encroach; (ii) CPW position on whether construction activity within line-of-sight of the nest during December 15–July 15 satisfies CPW's no-permitted-activity recommendation; (iii) USFWS BGEPA compliance documentation; (iv) Army Corps Section 404 jurisdictional determination of record including mitigation of indirect negative impact of hydrology of riparian wetlands; and (v) CPW protected-species survey results for golden eagle, bald eagle, prairie dog, burrowing owl, and SWAP-Tier 1 bats. The CPW comment letter itself remains unanswered in the developer's consolidated response and is

independently preserved within the procedural-defect argument (Section XI). Silence on these federal and state predicates is not a finding.

X. DEFERRED FINDINGS DO NOT APPLY TO MATERIAL DEFICIENCIES

In Colorado, a city cannot punt substantive statutory prerequisites to a future date, a building permit, or a private Development Agreement. If a finding is *required by law* to approve the development, it must be satisfied *before* or *at the time of* the approval, otherwise a city is acting in an arbitrary and capricious manner. The City may not approve a development by deferring substantive findings to post-approval conditions where those findings go to statutory prerequisites whereas a ministerial detail or routine monitoring would be appropriate to attach as a post-approval condition. The Resubmittal 2 packet is built on a "defer to the next stage" architecture: numerous substantive issues are pushed into a future Development Agreement that is not yet drafted, not before the Planning Commission, and not subject to public hearing. Examples in the developer's own words:

> *"Wildfire mitigation plans will be prepared at the time of the development of Preliminary Plans and will be adopted with the approval of the Preliminary Plans. ... Long-term maintenance expectations and responsibilities for open space, common areas, and private lots will be further detailed in the Development Agreement." — R2 SAP, § 2.4.10 (Preparing a Wildfire Resilient Environment), p. 25.*

Items currently "reserved" or unresolved in the record include: C.R.S. § 29-20-304 water adequacy; CWRC § 302.1 Fire Intensity Classification; IFC § D107.1 AHJ determination; SMFR § 403 / § 404 adequacy memo; CGS slope-stability review under § 34-1-302; CPW concurrence with the 0.9-mile eagle buffer geometry; Douglas County Public Works consent under § 43-1-106 for both McArthur and N. Heather EVAs; 2020 Roadway Easement scope analysis under *Lazy Dog Ranch*; SAP variance and amendment procedures; setbacks (now deleted); height variance methodology; Comprehensive Plan findings; and the alternative water-quality design that replaced Tract M.

When a city defers a substantive requirement into an un-drafted Development agreement, it pushes those decisions post-public hearing which denies the public and the Comission the opportunity to review and shape the project. It further fails to address, in this case, statutory criteria (such as traffic mitigation and geographic standards) that the approving body may not have a legal basis to grant an approval if not proven during the public hearing process.

Finding Requested. Each of the above must be resolved on the record before approval. Conditional approval that defers statutory prerequisites is vulnerable under C.R.C.P. 106(a)(4). The "defer to the Development Agreement" architecture is not a finding; it is the absence of one.

XI. PROCEDURAL DEFECT - THE CITY'S FEBRUARY 11, 2026 DIRECTIVE

The City's February 11, 2026 review letter expressly directed the applicant to provide a consolidated response to *"all referral comments received."* The developer's March 27, 2026, R2 packet contains consolidated response letters addressed to City Planning and City Attorney comments, a separate Brownstein Hyatt response to The Retreat at Ridgegate Homeowers Association, Inc., and a single Community Response Letter aggregating neighbor concerns. The R2 packet does not contain item-by-item responses to the referral letters from CGS, CDOT (other than the developer-prepared I-25 memo addressing only the interchange ramp signals), CPW, Douglas County Public Works, the Surrey Ridge Association, or the McArthur Drive Coalition. Several substantive comments from these agencies and stakeholders therefore remain unrebutted on the record. Pursuant to *Alpenhof, LLC v. City of Ouray*, 2013 COA 9, ¶ 9 , an approval that lacks competent evidence in the record is an abuse of discretion.

> **Finding Requested.** The City must require the applicant to file a true consolidated, item-by-item response to all referral comments (including CGS, the full set of CDOT comments, CPW, Douglas County Public Works, Surrey Ridge, and the McArthur Drive Coalition), and satisfy statutory requirements, before any further hearing or approval. Anything short of that leaves the record absent on the agency comments the City itself directed the applicant to address, which would prejudice any party pursuing a C.R.C.P. 106(a)(4) appeal.

XII. CONCLUSION AND REQUESTS FOR ON-THE-RECORD FINDINGS

The deficiencies identified above are not policy preferences. They are statutory and code requirements that the City must satisfy on the record. We respectfully request that the City make each of the following findings on the record before approval and, where findings cannot be made on the present record, require the developer to resubmit:

1. C.R.S. § 29-20-304 - State Engineer adequate-water-supply determination of record, addressing the Off-Site Utility Report's dependence on the future Freshfields development and the admitted Zone 3 hydraulic strain.
2. CWRC § 302.1 - Fire Intensity Classification for the parcel; CWRM GIS layer in the record.
3. CWRC §§ 402, 403, 404, 405–406, 504–505 - compliance demonstrated on the face of the preliminary plan, including reconciliation of the 3,136-ADT generation with the developer-admitted 400-vehicle-per-day surrounding Type III/IV capacity.
4. IFC § D107.1 - unconditional SMFR AHJ approval letter in the record (not a conditional referral letter).
5. C.R.S. § 30-28-136 - independent Colorado Geological Survey slope-stability review of record, with any missing borings completed and the "planning purposes only" qualifier cured.
6. C.R.S. § 24-67-105 - density findings tying the 343-unit count to demonstrated water, fire, geotechnical, and transportation capacity.
7. Comp Plan conformance findings on each implicated policy required. PDD inconsistency and amendment by Project rejected.

8. TIS findings - compliance with a standard study scope; CDOT access permit completion; cure of LOS F at SB I-25 Off-Ramp E2 SB Left PM; cumulative, weekend, and GPS-routing analysis; Hillcamp Trail and EVA operational and land use analysis.
9. Federal and State wildlife, BGEPA / MBTA / CPW, confirm CPW concurrence with the developer's 0.9-mile eagle distance and 0.4-mile buffer-edge geometry; CPW position on construction within the buffer projection; protected-species surveys (golden eagle, bald eagle, prairie dog, burrowing owl, SWAP-Tier 1 bats).
10. Access, Use, and Authority to Use Property, including required Douglas County Public Works consent (not Parks and Recreation's narrow F-350 maintenance email) for County-road use under § 43-1-106; extraterritorial-impact findings under § 24-65-103, the 2020 Roadway Easement (Reception No. 2020069125) - scope analysis placed in the record before approval, Tract M replacement - independent review of the post-Tract-M water-quality redesign to confirm it does not relocate stormwater impacts onto the unstable hillsides above Surrey Ridge.
11. Deferred findings must not contain material deficiencies or impacts that are punted down the road. A resolution on the record of each currently deferred substantive issue (no further "defer to the Development Agreement").
12. An applicant's consolidated, item-by-item response to all referral comments (CGS, full CDOT, CPW, Douglas County Public Works, Surrey Ridge, McArthur Drive Coalition) as directed by the City's February letter.
13. Ensure all adjacent owners, including in unincorporated Douglas County, have received proper notice of the Project and impacts while the referral period is ongoing rather than after the time for meaningful input has concluded; at Planning Commission or City Council hearings.

We respectfully request that the City make the findings identified above before any further action on RG24-0007, SB25-0009, SB25-0010, or SB25-0014.

Respectfully submitted,

/S/

Lone Tree, CO. 80124

26 May 2026

To the Lone Tree Planning Commission, City Council,

I am writing to oppose the Hillcamp Sub-Area Plan. The proposed building and access road for the Hillcamp development is not well planned as evidenced by the lack of foresight related to access or egress. In this area considered a higher fire risk, to only have one road in the event of an emergency is not adequate by any means. In addition, with our water already considered strained there is no further planning on how to support this housing area and landscaping.

In addition, we are losing our greenspace and wildlife which is why Lone Tree is unique. Population density is only increasing and this development will only create more traffic issues than exist in the current state.

I have lived in Lone Tree for 25+ years and am a Colorado native. I moved to Lone Tree because I believe in responsible government and excellence in planning. This proposal falls well below these reasonable expectations and creates a decrease in both health, safety and quality of life.

I do not support this plan as a nurse and as a community member.

Sincerely,

Kim Muramoto (signed electronically)

Re: Referral-Period Comments, Hillcamp / Southridge Preserve, Resubmittal 2 (March 27, 2026)

Dear Members of the Planning Commission and City Council:

I submit these comments on the developer's March 27, 2026, Resubmittal 2 packet for the Hillcamp / Southridge Preserve development (the **"Project"**) as a resident of the Surrey Ridge community. The comments are timely filed within the second-referral comment period and are intended to become part of the administrative record for the four pending applications.

The Project proposes 343 single-family detached lots on approximately 392 acres located on a landlocked parcel atop the mesa tops in a high wind location with no water, and an adjacent landslide, straddling the RidgeGate 7th Amendment PDD (**"RGPD"**) and the Southridge Preserve PDD (**"SPPD"**), accessed primarily via Hillcamp Trail (the extension of Cabela Drive) to RidgeGate Parkway, with proposed emergency-vehicle-only access (**"EVA"**) from McArthur Drive to the west and from N. Heather Drive to the south.

Approval will occur *after* the City of Lone Tree's adoption of the Colorado Wildfire Resiliency Code (**"CWRC"**) on second reading on April 21, 2026 (effective July 1, 2026). On the record now before the City, the Project application cannot be approved consistent with C.R.S. § 29-20-304 (water adequacy), C.R.S. § 34-1-302 (geological hazards), C.R.S. § 24-67-105(4) (PDD density findings), the CWRC, the IFC second-access requirement, the RidgeGate PDD Main Access Road designation, and C.R.S. § 24-65.1-103 (Douglas County Hazard Mitigation Plan). The deficiencies are not policy preferences but required findings the City must make on the record before any approval.

We further note that The Retreat at RidgeGate Homeowners Association, also opposes these four applications. Surrey Ridge's opposition and The Retreat's opposition arise from different property interests but converge on the same statutory and code grounds: failure of approval criteria, PDD inconsistency under C.R.S. § 24-67-105, which every planned unit development is to be evaluated against, and not to be inconsistent with the standards and conditions set forth in the adopting resolution or ordinance. In this case, the record demonstrates the Colorado Geological Survey's January 30, 2026, insufficiency finding, the developer's decline to respond to referral agencies in this second referral submission, as the City directed, and procedural notice defects across the four-application package. The City should treat the convergence as evidence that the deficiencies are not isolated objections but systemic record gaps the applicant has chosen to leave on the record.

I. WATER ADEQUACY - MANDATORY JURISDICTIONAL FINDING (C.R.S. § 29-20-304)

C.R.S. § 29-20-303 provides that a municipality *"shall not"* approve a development without an adequate water supply finding plan demonstrating water availability, dependability, and infrastructure capability. This is mandatory, not discretionary. No City or State Engineer determination exists in the record.

The developer's Off-Site Utility Report (Merrick Project No. 100618, March 2026) discloses material vulnerabilities in the proposed supply that the City must make findings on:

- Two PWSD sources: Zone 2 (via the proposed new Hillcamp Booster Pump Station ["HCBPS"], pressurized from RidgeGate) and Zone 3 (gravity-fed).
- The Zone 3 transmission main is "connected at the north end of the Canyons development and routed through the future Freshfields development." One of two "redundant" sources thus depends on a development that does not yet exist.
- The Off-Site Utility Report concedes that "Zone 3 water storage tanks … already have trouble balancing hydraulic grade lines during high demand periods under pre-development conditions" — i.e., the system the developer plans to rely on is already strained without Hillcamp's 343-home load.
- The new HCBPS, multiple parallel transmission lines (260 LF of 6" DIP, 366 LF of 12" PVC, 3,474 LF of 12" DIP, 13,520 LF of 16" PVC, 8,601 LF of 16" DIP), an I-25 crossing, 17 fire hydrants and 12 air-release valves must all be built before the supply is actual rather than theoretical.

In parallel, the Southridge City Response Letter (March 27, 2026) confirms that "Water supply evaluation, confirmed by PWSD and SMFR, required prior to plat approval," the City's own acknowledgement that the § 29-20-304 finding has not yet been made.

> **Finding Requested.** Given material deficiencies and the impact to adjacent land owners with wells as well as necessity to mitigate fire risk, the City should either make a determination of what is required of the developer before resubmitting for further referral processes or refer the Project to the State Engineer for a formal C.R.S. § 29-20-304 adequate-water-supply determination (and include the determination in the record before approval). The City must also make a separate CWRC §402 conforming-water-supply finding (see Section II.D).

II. FIRE AND LIFE SAFETY - REQUIRED FINDINGS (CWRC; IFC § D107.1)

A. Lone Tree CWRC Adoption (April 21, 2026; Effective July 1, 2026) Governs at Approval

On April 21, 2026, the Lone Tree City Council adopted the Colorado Wildfire Resiliency Code ("CWRC") on second reading, with an *effective date of July 1, 2026*. The CWRC implements the state Wildfire Resiliency Code Board rule (8 CCR 1507-39, promulgated under SB 23-166) and the City's Community Wildfire Protection Plan (adopted June 17, 2025). The CWRC governs new construction, additions, substantial improvements, and *new subdivisions and planned unit developments* within designated WUI areas.

The Project lacks materiality in the current applications that requires further review. Final Plat approval and building-permit issuance, will occur *after* the City has adopted the Code and after CWRC's July 1, 2026, effective date. Under C.R.S. § 24-68-103(1)(b), a Colorado statutory vested property right attaches only upon conditional or formal approval of a site-specific development plan, which has not occurred. The CWRC is the governing code at the time the City must make its findings. Preliminary approval that is internally inconsistent with CWRC compliance is ripe for challenge because it rests on infeasibility.

B. CWRC § 302.1 - Fire Intensity Classification

CWRC § 302.1 requires the City to declare the WUI areas within its jurisdiction based on findings of fact, recorded on publicly inspectable maps. The City's February 2026 staff report to City Council on CWRC adoption classifies all WUI areas within Lone Tree as either Class I (High Intensity) or Class II (Moderate Intensity) - there is no Class III (Low) designation. Lone Tree's Staff Report to the City Council, dated January 2026, stated, in part, "Lone Tree has identified wildfire risk mitigation as a priority in the Regional Hazard Mitigation Plan for almost a decade." *Staff Report: Overview of Colorado Wildfire Resiliency Code, Colorado Wildfire Resiliency Code Map, and Associated Proposed Minor Amendments to Municipal Code p.7, January 2, 2026*. The developer's own Wildfire Mitigation Plan (HPTT 2025) characterizes the surrounding fuels environment as a wildfire-prone area with confirmed "breaches of the HIZ" (Home Ignition Zone) in adjacent Surrey Ridge and McArthur Ranch communities. The R2 packet does not classify the parcel under § 302.1; instead the SAP pushes wildfire mitigation to a future Development Agreement.

> **Finding Requested.** The City must make the § 302.1 Fire Intensity Classification finding for the Hillcamp parcel on the record before approval and place the Colorado Wildfire Resiliency Map (CWRM) GIS layer for this parcel into the record. The City must also require an SMFR § 403 / § 404 adequacy memo on the present plan geometry. The classification finding is a finding of fact the City, not the applicant, must make.

C. IFC Appendix D § D107.1 - Two Fire-Apparatus Access Roads

IFC § D107.1 requires two fire-apparatus access roads for developments exceeding 30 dwelling units. The Project proposes 343 homes on a landlocked mesa-top with high winds, served by a single public collector (Hillcamp Trail / Cabela Drive extension) and exceeds this 30-unit threshold by more than 1,000%.

Using Hillcamp Drive (an extension of Cabela Drive) as the primary public route funnels 343 homes onto a single collector. A development of this scale sitting on a mesa-top poses a severe public safety risk if a wildfire or vehicle incident blocks that sole roadway. Further, the geography of the Lone Tree Bluffs area, a high, exposed mesa-top, is known for high winds. High winds cause fires to spread exponentially faster, meaning evacuation routes must be highly reliable, wide enough for two-way traffic, and clear of hazards.

Utilizing the McArthur Ranch Emergency Vehicle Access ("EVA") road as a secondary option for 343 homes presents its own set of problems. Standard fire apparatus roads require a minimum unobstructed width (usually 20 to 26 feet depending on the jurisdiction) and strict slope limits. Because the McArthur EVA is reportedly deficient in both slope (roughly 10%) and width (narrow), standard fire engines and heavy rescue vehicles may be unable to navigate it, rendering it unsafe as a true secondary means of egress. Moreover, Surrey Ridge opposes *any* connection to the neighborhood given unfunded traffic, roadway and fire impacts.

Douglas County owns rights of way between the Project and proposed access points; and, it seems, those areas will not be paved, and thus not meet SMFR's requirements. Further, we did not see a referral from Douglas County planning approving such use of its right of way.

SMFR's February 4, 2026, referral letter identifies open code violations and is conditional, not an unconditional AHJ approval. No SMFR concurrence letter is in the R2 packet. The R2 SAP recites only that *"All roadways shall meet the emergency access requirements of South Metro Fire Rescue."* R2 SAP, § 2.11.3 (Public and Private Ownership and Maintenance of Roadways), p. 35. That statement is a recital, no facts exist and it is not approval.

On May 15, 2026, a fatal accident occurred on I-25 between Happy Canyon and Castle Pines Parkway exits (the south exit that would serve a Surrey Ridge EVA), shutting down the highway for at least three (3) hours. Residents were stuck on the roads from Lone Tree down to Castle Rock downtown, because arterial access roads abutting the highway, including use of the ones proposed, are not sufficient to handle the existing vehicle load. Adding 3,100+ trips onto unfunded, rural roads rated for 400 cars, in an already deficient traffic scenario violates the City's obligations to protect its citizens and their property. It could result in deaths if a fire emergency were to occur. The developer's argument that an additional access to Surrey Ridge through the Hillcamp development, would protect those residents is a thinly veiled guise to get the approval they need to start construction. There is no modeling showing that Surrey Ridge households would be able to get up to, and through, the proposed Project and would be in the back of a queue of a minimum of 1,000 cars based on the household density in the application. This is not a true safety measure.

> **Finding Requested.** The City must make an express finding on the record either (a) that IFC § D107.1 is satisfied by an *unconditional* SMFR AHJ approval letter included in the record before approval, or (b) that D107.1 is not satisfied and two compliant access roads must be in place before approval. A conditional referral letter cannot be treated as the unconditional AHJ approval D107.1 requires. IFC D107.1 demands that access roads *be provided* or legally excepted. Approving a project with conditions that conflict with life safety elements leaves the local

> government legally exposed. A conditional referral does not provide the concrete assurance the fire code requires. SMFR Attachment 1 supersedes the IFC where more restrictive, and SMFR is the AHJ; any developer argument that IFC § D103.2 permits grades up to 10% does not displace SMFR's more-restrictive standards.

D. CWRC § 402 - Conforming Water Supply for WUI Subdivisions

CWRC §402 requires a subdivision in a Moderate or High WUI area to have a conforming water supply meeting minimum flow, duration, and hydrant spacing. The Resubmittal 2 packet contains no CWRC-compliant fire-flow certification. In the absence of such certification and with notification that pressure in the existing water supply is deficient preconstruction, the City can either make a determination this is adequate, or request a letter from the State Engineer of adequate-water determination required by C.R.S. § 29-20-305 (Section I above). All findings are missing.

> **Finding Requested.** The City must require a CWRC § 402 conforming-water-supply certification and a CWRC-conforming hydrant-spacing plan, both on the face of the preliminary plan, before approval.

E. CWRC § 403 - Fire-Apparatus Access Roads (Developer's Own Admissions on the Record)

CWRC § 403 requires adequate width, turning radii, vertical clearance, and a second point of ingress/egress unless the IFC § D107.1 sprinkler exception is satisfied *and* the AHJ unconditionally approves. Adequate width is typically 20 feet but frequently increases to 26 feet in the vicinity where fire hydrants are present. The R2 packet contains two material developer admissions on the record:

> *"McArthur Ranches and Surrey Ridge near Hillcamp are both served by Rural Local type III and IV roads. These roads are designed to handle up to 400 vehicles daily that currently dead-end South of the proposed Hillcamp neighborhood." — Wildfire Mitigation Plan (HPTT 2025), § 1.1.*
