Keith Simon  
Board President  
Rampart Range Metropolitan District No. 1  
8390E. Crescent Pkwy, Ste. 500  
Greenwood Village, CO 80111

Re: Acknowledgement of Water Resource Credits of Rampart Range Metropolitan District No. 1 for RidgeGate Development

Dear Mr. Simon,

This letter serves to acknowledge that PWSD has credited the Rampart Range Metropolitan District ("Rampart") with an additional 306 SFEs in water resource credits as a result of the completion of the Arapahoe Alternate Wells Case and conveyance of the RRC-9(A) well site to PWSD. This acknowledgement is pursuant to Section 6(a) of the Intergovernmental Agreement for Water and Sewer Service dated December 13, 2006, and recorded with the Douglas County Clerk and Recorder's Office on January 31, 2007, at Reception No. 2007009350, as amended by the First Amendment to Intergovernmental Agreement for Water and Sewer Service dated September 13, 2012 and recorded with the Douglas County Clerk and Recorder's Office on October 5, 2012, at Reception No. 2012075572, and Section 7 of the First Addendum to Intergovernmental Agreement for Water and Sewer Service dated July 22, 2014 and recorded with the Douglas County Clerk and Recorder's Office on August 8, 2014 at Reception No. 2014044603.

The total number of water resource credits provided to Rampart pursuant to the terms of the above-referenced agreements is 4,849 SFEs for the RRC well water rights and 3,741 SFEs for the non-RRC well water rights. Please do not hesitate to contact me if you have any questions or concerns regarding this matter.

Sincerely,

Ron R. Redd, P.E.  
District Manager

**8589 total water  
resource credits**

## **CERTIFICATIONS**

I hereby affirm that this report (plan) for the overall utility design of Ridgegate Southwest Village was prepared by me (or under my direct supervision) for the owners thereof in accordance with the provisions of the Parker Water & Sanitation District Standard Specifications. I understand that Parker Water & Sanitation District will not assume liability for water or sanitary sewer facilities designed by others.

---

Aaron Clutter, Registered Professional Engineer  
Colorado Professional Engineer No. 36742  
For and On Behalf of JR Engineering, LLC.

## **PROJECT LOCATION AND DESCRIPTION**

The Ridgegate Southwest Village development is located in Sections 23 and 24, Township 6 South, Range 69 West and Section 18, Township 6 South, Range 67 West of the 6th Principal Meridian. The site is located to the south of Ridgegate Parkway, and east of Interstate Highway 25 (I-25). The site is bisected by reaches of Happy Canyon Creek and Badger Gulch. The site is shown in the Vicinity Map in Appendix A.

The Ridgegate Southwest Village development will occupy approximately 698 acres and encompass 1788 single family residential lots, 176 multifamily lots, 13 acres of commercial development, a regional park, a school, and three community parks. The property is currently vacant and comprised of open space.

## **SANITARY SEWER SYSTEM**

### **General Description**

Currently, there are no known existing sanitary sewer lines within the site. There is an existing 24" sanitary sewer line within Ridgegate Parkway that routes wastewater to the Happy Canyon Creek sanitary sewer system. There is a separate system of 12" sanitary sewer mains in development within Ridgegate further to the east that will route wastewater to the Badger Gulch sanitary sewer system. Wastewater from the Ridgegate Southwest Village development will be serviced by the existing North Water Reclamation Facility. The existing gravity sanitary sewer collection mains to service the site are owned by Parker Water and Sanitation District (PWSD) and are located north of the site in Ridgegate Parkway.

The proposed Ridgegate Southwest Village development will be serviced by an internal sanitary sewer system comprised of eight, twelve, and eighteen inch mains. The Ridgegate Southwest Village system of sanitary mains will route wastewater from future adjacent developments through the site. The projected future offsite sanitary flows have been accounted for within this report and will come from a force main/sanitary lift station to the west of the sub-division and a portion of "Freshfield" a single-family development projected to be built south of the site. Stub locations to surrounding sites are shown on the Sanitary Sewer Exhibit located in Appendix C. The collection system will convey wastewater flows via gravity to both the northwest and northeast corners of the site to both existing and future/planned mains. The wastewater tributary to the northwest existing sanitary sewer falls within the Ridgegate Southwest Village sanitary basin from the Parker Water & Sewer Master Plan Figure 6-2 Located in Appendix C. The wastewater tributary that flows to the northeast connection falls within the Badger Gulch sanitary basin within the Master Plan Figure 6-2. All Ridgegate Southwest Village development effluent will ultimately gravity flow to the Ridgegate East Lift Station and then on to the North Water Reclamation Facility.

### **Sanitary Sewer Loading Design**

The sanitary loads within the site were determined from the East Ridgegate Sanitary Sewer Master Study dated March 2017, by Merrick and Company.” Sanitary Loading criteria used for the site analysis are summarized in Table 1 below.

**Table 1:**

Type of Use	Unit Flow (Average Daily Flow)	Peaking Factor (Peak Flow vs. Avg. Day)
Residential: Single Family	197/SFE	3.655
Residential: Multi-Family	197/SFE*2/3	3.655
School	25 gpsd	1.38
Recreation Center	40 gpvd	3.655
Regional Parks/Community Parks	1,500/gpd	----

Table 1: Ridgegate Sanitary Loading Criteria

*SFE: Single Family Equivalent*

*gpsd: Gallons per Student per Day*

*gpvd: Gallons per Visitor per Day*

Using the above criteria, the sanitary loading was developed for the overall site and is shown in the “Wastewater Loading for Ridgegate Southwest Village” development calculation sheet within Appendix B.

## **Pipe Analysis**

Each pipe/conduit in the proposed sanitary sewer system was designed to meet all of the Parker Water & Sanitation Department's design standards and criteria as shown within **Table 2** below.

**Table 2:**

Sewer Size (inches)	Minimum Slope (Feet per Hundred)	Maximum Slope (Feet per Hundred)
8	0.4	15
10	0.28	12
12	0.2	11
15	0.15	8.5
18	0.12	6.5
21	0.092	5
24	0.08	4.5

Pipe sizes were selected based on design flows and proposed pipe slopes to provide adequate capacity. Sanitary trunkline conduits were designed with a minimum velocity of two feet per second with pipes flowing no more than 60 % full for sewers that are 10-inch or smaller, and 50% full for sewers that are 12-inch or larger. All of the trunkline sanitary conduits in the proposed Ridgegate Southwest Village conform to these parameters (see calculations in Appendix B).

## **Sanitary Sewer Routing**

The basins on the site were delineated to evaluate the primary trunkline(s) that will service the Ridgegate Southwest Village sanitary collection system. For additional information regarding average daily flows, peaking factors, velocity, conduit capacity, sanitary main sizes, and infiltration, refer to the "Wastewater Loading for Ridgegate Southwest Village" development calculation sheet as shown within Appendix B and the "Ridgegate Southwest Village - Sanitary Sewer Exhibit" located within Appendix C for individual conduit sizing and referenced sanitary sewer design points.

## **Basin A**

Basin A consists of the western portion of the development is comprised of single-family units, multi-family units, school, rec center and regional parks. The sanitary collection system for basin A will receive additional loading from a planned lift station to be installed by others at an access point near S. Havana St. that is located adjacent to the southwestern corner of the development. In addition, the basin's collection system will collect anticipated loads from Freshfield (a proposed development to the south of the site) and receive infiltration flows from surrounding parks and land within the basin. Loads from basin A will ultimately outfall into a 24" sanitary sewer located within Ridgegate Parkway - part of the Happy Canyon Tributary, as shown in the Sanitary Sewer Exhibit in Appendix C.

Basin A was broken up into nine smaller sub-basins to size the main trunk lines that will service basin A as described below.

- Basin A1 consists of the southwestern upstream portion of basin A. Basin A1 receives offsite sanitary loads from a future lift station south of Havana Street that will serve 258 SFE. Basin A1 will receive additional onsite sanitary loads from single-family units. The main trunkline serving basin A1 was sized to be an 8" main. The total combined wastewater loading from Basin A1 can be found in the calculations at Design Point 1A (DP1A).
- Basin A2 is comprised of single-family units and the sanitary loading associated with upstream basin A1. Basin A2 will receive additional offsite loading from a future development named Freshfield that is upstream to the south of the site. The Freshfield loading was assumed to be 300 SFE. The main trunkline serving basin A2 was determined to a 10" main. The total combined wastewater loading within Basin A2 can be found in the calculations at Design Point 2A (DP2A).
- Basin A3 is comprised of sanitary loading generated from single-family units and from upstream basins A1 and A2. The main trunkline serving basin A3 and was determined to be a 10" main. The total combined wastewater loading within Basin A3 can be found in the calculations at Design Point 3A (DP3A).
- Basin A4 is comprised of sanitary loading generated from a combination of single-family units, multi-family units and loadings associated with upstream basins A1-A3. A 12" main was found to have adequate capacity for the calculated loading. The total combined wastewater loading within Basin A4 can be found in the calculations at Design Point 4A (DP4A).
- Basin A5 is comprised of sanitary loading generated from single-family units and a proposed recreation center. An 8" main was found to have adequate capacity for the calculated loading within basin A5. The total combined wastewater loading within Basin A5 can be found in the calculations at Design Point 5A (DP5A).

- Basin A6 collects loads from single-family residential, multi-family residential units, infiltration from a region park, and a school. Sanitary loading generated in basin A6 utilizes a separate trunkline from the one the services basins A1-A5. An 8” main was found to have adequate capacity for the calculated loading. The total combined wastewater loading within Basin A6 can be found in the calculations at Design Point 6A (DP6A).
- Basin A7 collects sanitary loads from single-family residential and multi-family residential units. Sanitary loading generated within this basin confluence with the combined loadings from basins A1-A6 and A8 at Design Point 7A (DP7A). The main trunkline serving basin A7 and was determined to be an 8” main until the confluence point where the line size is increased to 18”.
- Basin A8 receives infiltration from regional park A1. The main trunkline for basin A8 was sized to handle upstream loads from basins A1-A6. Sanitary loading generated within this basin confluence with the combined loadings from basins A1-A6 and A8 at Design Point 7A (DP7A). The main trunkline serving basin A7 and was determined to be a 15” main until the confluence point where the line size is increased to 18”.
- Basin A9 receives loads from all of the upstream A basins and planning area SFA-A4. An 18” main was found to have adequate capacity for the calculated loading. The total combined wastewater loading within Basin A9 can be found in the calculations at Design Point 8A (DP8A).

For additional information regarding average daily flows, peaking factors, velocity, conduit capacity, sanitary main sizes, and infiltration, refer to the “Wastewater Loading for Ridgegate Southwest Village” calculation sheet as shown within Appendix B and the “Ridgegate Southwest Village - Sanitary Sewer Exhibit” located within Appendix C.

### Basin B

Basin B is located in the central portion of the development. The sanitary collection system for basin B will receive loads from single-family and commercial development. The effluent sewage from basin B will ultimately outfall into a 12” sanitary sewer located within Ridgegate Parkway, that is tributary to Badger Gulch. An 8” main was found to have adequate capacity for the calculated loading. For additional information regarding average daily flows, peaking factors, sanitary main sizes, velocity, conduit capacity, and infiltration, refer to the “Wastewater Loading for Ridgegate Southwest Village” calculation sheet as shown within Appendix B and the “Ridgegate Southwest Village -Sanitary Sewer Exhibit” located within Appendix C.

### Basin C

Basin C is located in the eastern portion of the development. The sanitary collection system for basin C will receive flows from planned single-family development. The effluent wastewater from basin C will ultimately discharge into design Ridgegate Parkway to a 15" Sanitary Sewer that is tributary to Badger Gulch.

- Basin C1 is comprised of single family units. An 8" main was found to have adequate capacity for the calculated loading within basin C1. The total combined wastewater loading within basin C1 can be found in the calculations at Design Point 1C (DP1C).
- Basin C2 is comprised of single family units and from upstream basin C1. The main trunkline serving basin C2 was determined to be an 8" main.

For additional information regarding average daily flows, peaking factors, sanitary main sizes, velocity, conduit capacity, and infiltration, refer to the "Wastewater Loading for Ridgegate Southwest Village" calculation sheet as shown within Appendix B and the "Ridgegate Southwest Village - Sanitary Sewer Exhibit" located within Appendix C.

## **WATER DISTRIBUTION SYSTEM**

### **General Description**

The proposed water distribution system for Ridgegate Southwest Village consists of eight, twelve, twenty and twenty-four inch mains looped throughout site. The site's elevation ranges from 5,992 to 6,168 feet. The water distribution system for Ridgegate Southwest Village will tie into a future twenty-four inch water main east of Badger Gulch. The Ridgegate Southwest Village water system will also tie into twelve, sixteen, and twenty inch water lines located in Ridgegate Parkway to the north. The final site connection will be to the west into an existing twenty inch water main located in South Havana Street. The "Ridgegate Southwest Village - Water Line Exhibit" has been provided within Appendix D for visual reference of the proposed system. The Ridgegate Southwest Village development is currently planning for 1,788 single-family units, 176 multi-family units, 13 acres of commercial area, one recreation center, one school with an assumed 1,000 students, and three parks. See the "Ridgegate Southwest Village" map located in Appendix A for a breakdown of the land uses and lot types for the development.

### **Hydraulic Design**

Design criteria used to analyze the hydraulics of the site were established using the "Parker Water and Sewer Standard Specifications Manual" and the approved "Ridgegate East Regional Master Plan" by Merrick. The following is a summary of the criteria:

#### **Max Day Criteria**

Minimum Pressure	40 psi
Maximum Pressure	120 psi
Maximum Velocity	7 ft/s
Maximum Head Loss	1 ft/100 ft

#### **Max Day Demand + Fire Flow Criteria**

Minimum Pressure	20 psi
Maximum Pressure	120 psi
Maximum Velocity	15 ft/s
Maximum Head Loss	5 ft/100 ft

#### **Fire Flow Demand**

Single Family	1,500 gpm
Commercial	3,000 gpm
Multi-Family	2,500 gpm

### **Domestic Demand Design**

The unit demands for the Ridgegate Southwest Village were taken from the approved “Ridgegate East Regional Master Plan”. A single family equivalent (SFE) was determined to be an average of 2.7 persons. Multi-family units were determined to be equivalent to 0.67 SFE. Domestic demand criteria used for the site analysis is summarized below.

#### **Potable Water Demands**

Average Day Demand	410 gal/SFE/day
Maximum Day Factor	2.5
Maximum Day Demand	1,025 gal/SFE/day
Peak Hour Factor	5
Peak Hour Demand	2,050 gal/SFE/day
Commercial	1 SFE/4,045 sf
School	0.37 SFE/student

See the “Potable Water Demand” table located in Appendix E for a full summary of demand distribution into the WaterCAD model.

### **System Design Analysis**

A WaterCAD model was created for the site to analyze the hydraulics of the proposed water system. The proposed water model included offsite demands to the west and north of the site that were taken from the Merrick InfoWater Model. The offsite demands were applied to nodes labeled offsite (OS) to get a more accurate representation of flow direction and pressure in the region. “Ridgegate - Water Line Exhibit” has been provided within Appendix D for visual reference of the proposed system. Scenarios were computed to analyze max day demand, peak hour demand, and max day plus fire flow demand conditions. The site falls within pressure zone 2 from the “Ridgegate East Regional Master Plan” which has a design hydraulic gradient of 6,315’ and serves elevations of 6,000-6,205’. Reservoir connections were modeled at 2 locations with an assumed static HGL of 6,315’.

### ***Maximum Day***

The maximum day demand scenario was generated utilizing the criteria established above. The lowest and highest onsite residual pressures for the max day model, with a reservoir HGL of 6,315, were 62.6 and 141.0 psi, respectively. There are a total of twenty-six junctions that exceed maximum residual pressure during max day conditions. These junctions fall between the elevation of 5,987.4

and 6,036.0 and have a pressure range of 120.2-141.0 psi. All junctions were above the minimum pressure of 40 psi and velocities ranged from 0.0-1.45 ft/s. PRVs may be installed prior to the lots with excessive residual pressure in order to meet PWSD maximum residual pressure criteria. When the model was computed with an HGL of 6,275', all nodes and pipes met PWSD residual pressure and velocity requirements. Model results have been tabulated in Appendix E.

### ***Peak Hour***

The peak hour demand scenario was generated utilizing the criteria established above. The lowest and highest onsite residual pressures for the peak hour model, with a reservoir HGL of 6,315, were 59.8 and 139.0 psi, respectively. There are a total of twenty junctions that exceed maximum residual pressure during max day conditions. These junctions fall between the elevation of 5,987.4 and 6,032 and have a pressure range of 120.5-139.0 psi. All junctions were above the minimum pressure of 40 psi and velocities ranged from 0.0-2.89 ft/s. PRVs may be installed prior to the lots with excessive residual pressure in order to meet PWSD maximum residual pressure criteria. When the model was computed with an HGL of 6,275', all nodes and pipes met PWSD residual pressure and velocity requirements. Model results have been tabulated in Appendix E.

### ***Maximum Day + Fire Flow***

The maximum day plus fire demand scenario was generated utilizing the criteria established above. Two scenarios were run in order to determine the worst case fire flow scenario within the subdivision. One scenario was applying the multi-family fire flow of 2,500 gpm to the highest elevation multi-family node which was node J-44. The second fire flow scenario was applying a 3000 gpm demand onto node J-142 which is directly adjacent to the 12 acre commercial area. The lowest and highest onsite residual pressures for the max day plus fire model with a 2,500 gpm fire flow applied at J-44, with a reservoir HGL of 6,315, were 52.6 and 139.8 psi, respectively. There are a total of twenty junctions that exceed maximum residual pressure during max day plus fire conditions. These junctions fall between the elevation of 5,987.4 and 6,030.0 and have a pressure range of 121.1-139.8 psi. All junctions were above the minimum pressure of 40 psi and velocities ranged from 0.0-8.56 ft/s. PRVs may be installed prior to the lots with excessive residual pressure in order to meet PWSD maximum residual pressure criteria. When the model was computed with an HGL of 6,275', all nodes and pipes met PWSD residual pressure and velocity requirements. Model results have been tabulated in

Appendix E. The lowest and highest onsite residual pressures for the max day plus fire model with a 3,000 gpm fire flow applied at J-142, with a reservoir HGL of 6,315, were 61.5 and 139.6 psi, respectively. There are a total of twenty-one junctions that exceed maximum residual pressure during max day plus fire conditions. These junctions fall between the elevation of 5,987.4 and 6,032.1 and have a pressure range of 120.2-139.6 psi. All junctions were above the minimum pressure of 40 psi and velocities ranged from 0.0-12.70 ft/s. PRVs may be installed prior to the lots with excessive residual pressure in order to meet PWSD maximum residual pressure criteria. When the model was computed with an HGL of 6,275', all nodes and pipes met PWSD residual pressure and velocity requirements. Model results have been tabulated in Appendix E.

## **CONCLUSION**

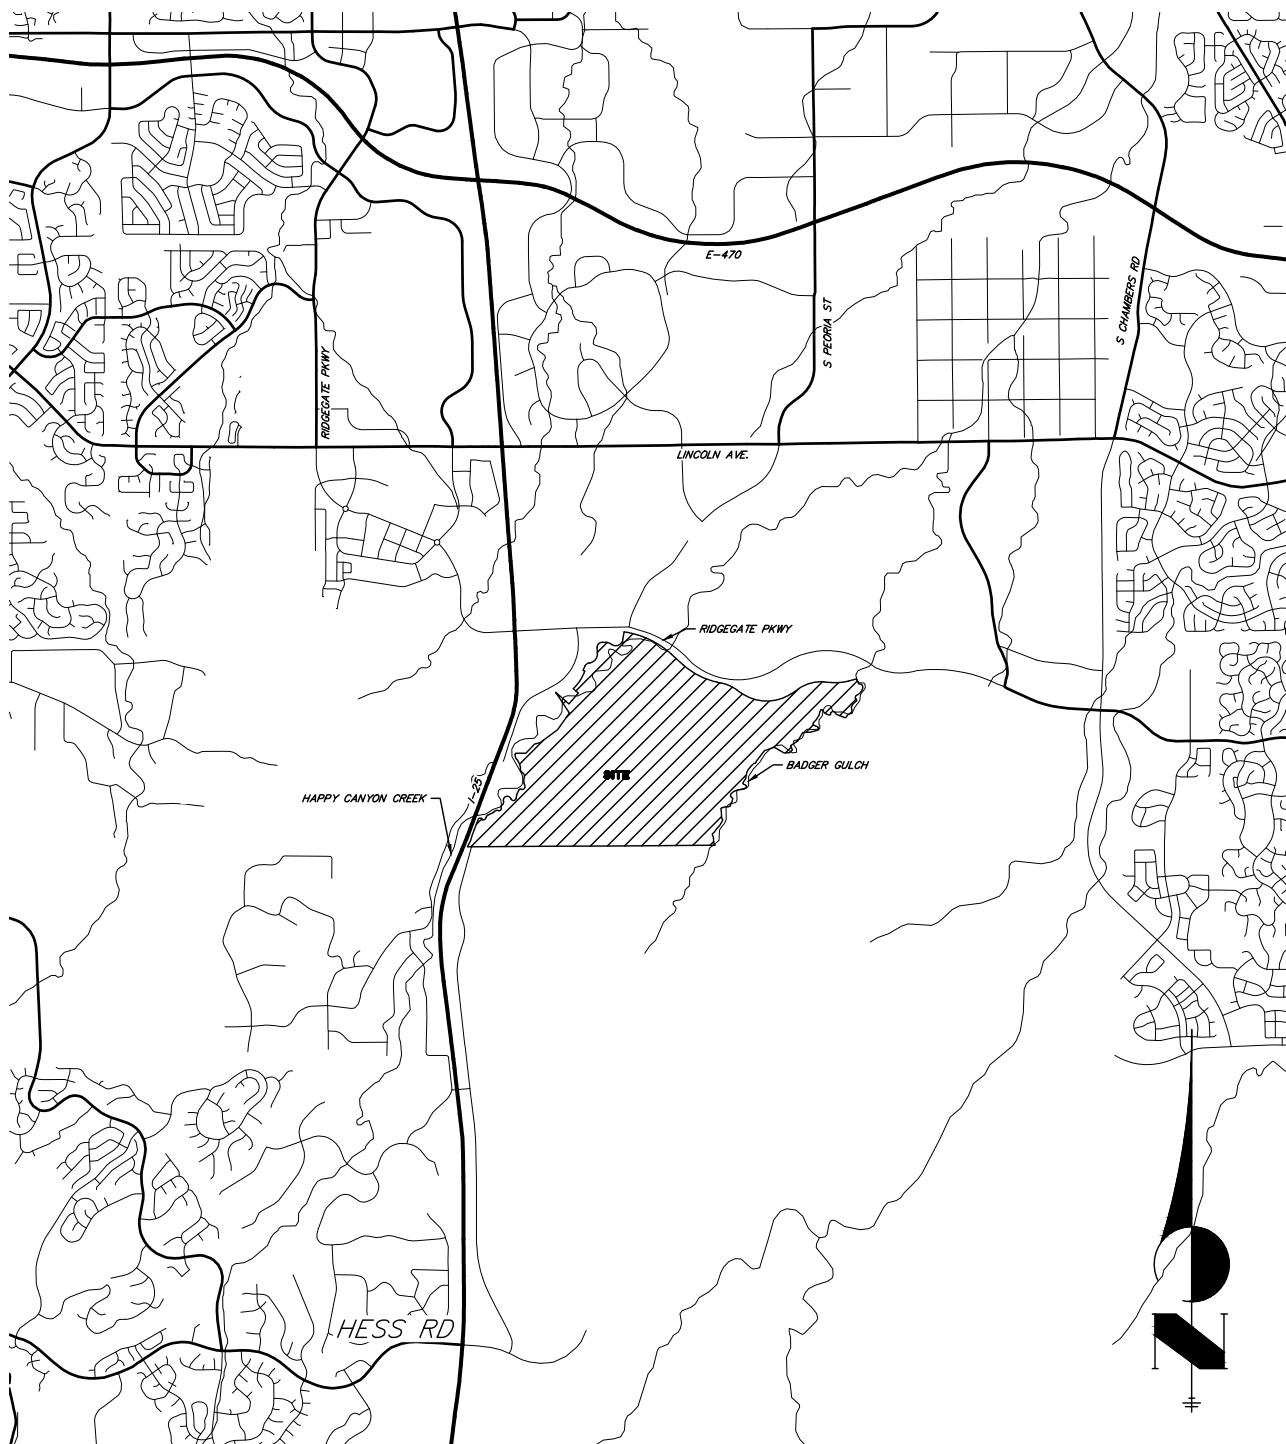

The proposed water and sanitary sewer systems that will service the Ridgegate Southwest Village development site have been demonstrated to be in compliance with the standards set forth by the Parker Water and Sanitation District and the Ridgegate East Regional Master Plans for Water and Wastewater Utilities.
