“This report (and plan) for the Phase I drainage design of Willow Creek PUD was prepared under my direct supervision in accordance with the provisions of the Douglas County Storm Drainage Design and Technical Criteria for the owners thereof. I understand that the City of Lone Tree does not and will not assume liability for drainage and erosion control facilities designed by others.

---

Thomas Pannell, PE  
State of Colorado No. 53615  
For and on behalf of Bowman Consulting

Furniture Row Colo, LLC hereby certifies that the drainage facilities for Willow Creek PUD shall be constructed according to the design presented in this report. I understand that the City of Lone Tree does not and will not assume liability for the drainage facilities designed and/or certified by my engineer and that the City of Lone Tree reviews drainage plans pursuant to Lone Tree Municipal Code, Chapter 15, Article 1; but cannot, on behalf of Willow Creek PUD, guarantee that final drainage design review will absolve Furniture Row Colo, LLC and/or their successors and/or assigns of future liability for improper design. I further understand that approval of the Site Improvement Plan and Final Plat does not imply approval of my engineer’s drainage design.”

## 1. General Location and Description

### 1.1 Site Location

Willow Creek PUD (hereafter, the Site) is located in the City of Lone Tree, Portions of the West half of Section 3 and the Northeast quarter of Section 4, Quarter Section NW ¼, Township 6 South, Range 67W, Douglas County, Colorado. The Site is located in the northeast quadrant of the intersection of Park Meadows Drive and Yosemite Street. The Site consists of Tract E and BA of the Park Meadows Subdivision, Filing 1, 1st Amendment and is bound by C-470 to the north, Yosemite Street to the east, Park Meadows Drive to the south, and Willow Creek to the west. The Site is also bordered to the west by the undeveloped Tracts I(A) and I(B) of the Park Meadows Subdivision, Filing 1, 1st Amendment, which includes a 200' ingress/egress easement.

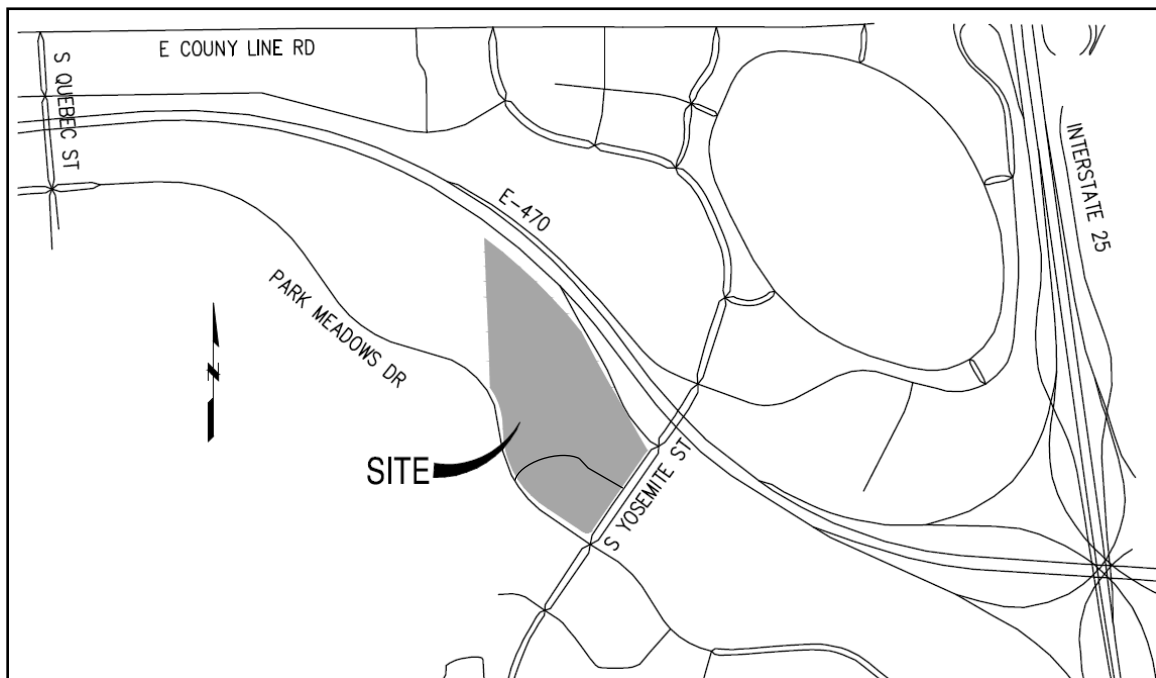

Figure 1-1  
Vicinity Map

### 1.2 Description of Property

The total area of the property is 14.12 acres. The ground cover is mainly short grasses with some trees and shrubs. Existing grades on the Site are moderate, ranging from 0-20% and averaging around 4-7%. The slopes closer to Willow Creek are steeper, with some slopes over 30% near the creek banks. The Site generally slopes to the west towards Willow Creek.

The Site is within a portion of the Willow Creek watershed which is a tributary of Little Dry Creek. The majority of the watershed is developed according a Flood Hazard Area Delineation (FHAD) report for Willow Creek by CH2MHill completed for Urban Drainage and Flood Control District in 2010.

Soils for the site are classified as NRCS hydrologic soils groups D per the Web Soil Survey from the USDA Natural Resources Conservations Service.

A small portion of the Site is within a regulatory floodplain per the Douglas County and City of Lone Tree Flood Insurance Rate Map (FIRM) Panel 42 Map No. 08035C0042G.

There are no existing irrigation canals on the site. There are no stock ponds located on the site.

The current zoning is Commercial C3 for Tract E and Business for Tract BA. The proposed road access bridge to the site from Park Meadows is located within the Tract I(B) which is zoned for Parks and Open Space.

## 2. Drainage Basins and Sub-Basins

### Existing Drainage Basins

Existing available drainage studies that impact the site are:

- Flood Hazard Area Delineation – Willow Creek, CH2MHILL, December 2010.
- Flood Insurance Rate Map, Douglas County and City of Lone Tree, Panel 42 Map No. 08035C0042G.
- Drainage Analysis for Park Meadows/C-470 and Starika Property, Carroll and Lange, Inc., March 1996, Last Revised April 1999.
- Construction Plans for C-470/Yosemite Interchange, Felsburg Holt & Ullevig, December 1995.

See Appendix E for the above drainage studies.

### Proposed Major Drainage Basins

**Basin A1** (8.87 ac) covers most of the Site and encompasses the proposed residential units, driveways, and landscaping areas. It runs along the east side of Willow Creek. This basin consists of 52.1% landscaping area, 30.4% hardscape, and 17.5% roof area. The 5-yr runoff coefficient is 0.42, the 100-yr runoff coefficient is 0.68, and the overall imperviousness is 47.2%. Runoff will be collected in a detention facility. (Q5=7.71 cfs, Q100=25.77 cfs).

**Basin A2** (4.49 ac) covers the south portion of the site along the north corner of Park Meadows Drive and South Yosemite Street. This basin consists of 33.9% landscaping area, 47.2% hardscape, and 18.9% roof area. The 5-yr runoff coefficient is 0.56, the 100-yr runoff coefficient is 0.75, and the overall imperviousness is 64.9%. Runoff will be collected in a detention facility. (Q5=7.60 cfs, Q100=20.92 cfs).

**Basin UD1** (0.76 ac) covers undetained sections of the Willow Creek streambank that flow off-site into the stream. This area consists of 100% landscaping area and has a 5-yr runoff coefficient of 0.05 and a 100-yr runoff coefficient of 0.49. The overall imperviousness is 2.0%. (Q5=0.12 cfs, Q100=2.31 cfs).

### 3. Drainage Design Criteria

#### 3.1 Development Criteria Reference

The Site was designed to comply with the Douglas County Storm Drainage Design and Technical Criteria Manual.

#### 3.2 Hydrologic Criteria

The Site is located within the Willow Creek Tributary watershed which was studied in the FHAD Report previously mentioned completed by CH2MHill. The basins that encompass The Yard at Lone Tree are Basin 26 and Basin 23 of the FHAD study. Sub-watershed characteristics information from the FHAD can be found in Appendix E of this report. A drainage analysis was previously prepared for Park Meadows/C-470 and Starika Property by Carroll & Lange, Inc in 1999 which examined the properties within the watershed upstream of the Site. Computations from this study were utilized to determine the flows of the 66" pipe which currently runs through the site. The existing pipe will be rerouted to avoid proposed site features, maintain adequate capacity to convey the existing flows, and will outfall to Willow Creek in generally the same location as they exist today. Large retaining walls along the western property line of the Site, which is also the low side of the site, constrain the ability to meet WQCV, EURV, and 100-year detention facility. A 100-year detention facility will be located on-site to provide water quality, EURV, and 100-year detention. Appendix F outlines the potential areas where above ground and below ground detention facilities could be implemented.

#### 3.3 Hydraulic Criteria

The Rational method was used to determine historic and developed flow rates. Runoff was calculated for the 5 and 100-year events. Times of concentration, rainfall intensities, and runoff coefficients were determined using the Douglas County Storm Drainage Design and Technical

Criteria Manuals and Urban Drainage and Flood Control District Manual, Volume 1. See Appendix A for Hydrological Calculations.

## 4. Drainage Facility Design

### 4.1 General Concept – Proposed Stormwater Conveyance/Storage Facilities

Proposed on-site stormwater conveyance will consist of a series of storm inlet connections to a full spectrum detention facility, that outfall into Willow Creek. Flows from the entire site will drain to this detention facility with a detention volume of 1.162 acre-feet. This detention volume may be in one or multiple ponds that will be determined at a later phase of development. See Appendix D for sizing calculations for the proposed pond.

Emergency overflow paths will be incorporated into the development. In particular, paths will be provided at the low points in the development to allow water to leave the Site during events exceeding the 100-year event, or if a failure occurs in the stormwater systems. Additionally, 1 foot of freeboard will be provided for the full spectrum detention pond with an overflow weir to allow for storm events larger than the 100-year event to safely pass through the facilities.

Proposed Storage Facilities					
ID	Area (acres)	Imperviousness	EURV (acre-ft)	WQCV (acre-ft)	100-YR Detention Volume (acre-ft)
Detention Facility	14.12	50.4%	0.674	0.244	1.162

## 5. Summary

The proposed stormwater management design outlined in this report is in general conformance with the City of Lone Tree, Douglas County Storm Drainage Design and Technical Criteria Manual, and the Urban Drainage Manual. Stormwater runoff will continue to follow existing drainage patterns to Willow Creek and all undetained flows will bypass the proposed detention facility and continue to Willow Creek as they have historically done. The proposed detention facility will provide Water Quality, EURV, and 100-year detention for the majority of the proposed site. The anticipated imperviousness of the site is 50.4%. Outflows from the detention facility will be released at or below the allowable release rates and will not adversely affect Willow Creek or any downstream properties. There is also proposed drainage improvements along Willow Creek by others that are shown in Appendix G.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

**Warning:** Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Castle Rock Area, Colorado

Survey Area Data: Version 15, Sep 1, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 9, 2021—Jun 12, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.
